Washington 25, D. C.

PRICES RECEIVED BY FARMERS FOR APPLES, 1934-56, AND PEARS, 1919-56  
Monthly and Season Average Prices and Value

This publication presents certain revised price and value statistics for apples and pears by States and the United States. Final 1957 and preliminary 1958 data were not available at date of publication.

The apple statistics include revised monthly prices for fresh consumption, June 1934-July 1957; a new series of season average prices for fresh consumption, and revised season average prices for all sales, fresh and for processing. Also included are revised estimates of the value of production and value of sales. They were derived by applying these prices to the present estimates of production having value and the quantity sold. To complete the historical series, apple price data for the crop years 1909-33 are included in the appendix. The value of production and sales for the years 1909-33 are published in Fruits (Noncitrus), Production, Farm Disposition, Value, and Utilization 1889-1944, CS-27, issued May 1948.

The revised pear statistics include season average price and value, by States and the United States for the crop years 1919-56. Estimates of prices begin in 1919 although production estimates begin in 1909. The pear statistics are the same as shown in earlier publications except for Oregon, Washington, and the United States. Prices and values for Oregon and Washington, 1919-56, are changed to the equivalent packinghouse-door returns basis, from the "as sold" formerly used. The revised United States price and value reflect these changes.

APPLES

The revised apple price estimates for 1934-56 are shown in Tables 1-4. There is no basis for preparing price estimates for the 1909-33 period comparable with the revised 1934-56 series. Price statistics for the earlier period are included in the appendix to bring together in one publication all such available price data.

Apple production estimates beginning with 1934 relate to the commercial apple areas of each State. Estimates for the earlier years relate to the total apple crop. However, the differences in the price series for the two periods are not explained by the difference in the production coverage. The season average price estimate for each State in the earlier years was derived from the monthly prices weighted by monthly sales. During that period there was no satisfactory method of assuring that sales for processing were properly represented in the monthly price estimates. For a large part of the quantity processed, prices were known only on a season average basis and could not be included in the current monthly estimates. Further, it was not until 1934 that separate estimates were prepared of the quantity sold for processing. Such estimates were needed to permit the proper combination of fresh and processing prices. Therefore, the monthly prices initially published and the season average prices derived from these monthly prices approximated the price for apples sold for fresh use. The season average prices derived from these monthly fresh market prices were used to evaluate production. So, for the 1909-33 period, the season average price and value estimates for the important processing States are on a higher level than if the lower priced sales for processing had been fully represented in the season average. The change in production estimates from "total crop" to "commercial" also reduced the level of the value estimates.

The 1934-56 revised season average apple prices are based on separate price estimates for apples sold for fresh consumption and apples for processing weighted by the estimated quantities of each sold. The procedure for combining separate price estimates for the fresh and processing portions was used for the important processing States in the revisions covering the years 1949-55 published in July 1956. Since that time such revisions have been completed for all States and extended back to 1934. The new series of season average fresh market prices was developed from the monthly estimates, revised on the basis of supplemental price data that became available after the marketing season ended. The monthly apple prices initially published have been used to compute the fresh market parity price. The revised monthly price series will be used beginning with July 1959.

In this publication, prices and value 1934-56 for Pacific Coast States are equivalent packinghouse-door returns for Washington and Oregon and the first delivery point returns for California. The former series for these States were on the "as sold" basis.

Processing prices 1934-56 shown in Table 3 were previously published in Fruit and Nut Prices 1909-46, issued October 1947 and brought to date by Supplements to Agricultural Prices, published in July 1952, July 1956, and July 1958. The United States average price for all processing sales was not available prior to the 1941 crop year. Processing prices for the earlier period, available only for selected items in selected States, are shown in the appendix, and in Table 1. The United States price series for canning for the years 1919-40 is based on the canning price in the six States--New York, Pennsylvania, Maryland, Virginia, Washington, and Oregon. These States accounted for a large share of the

Nation's canning crop in this period. Price estimates for California apples for drying are available beginning in 1909. In recent years, the price program has been expanded to collect price information for all processing categories in the 13 States accounting for most of the processing sales in the Nation. From 1941 forward, prices by type of processing were computed for the United States based on prices in the 13 important processing States and published for the first time in July 1952. In table 1 United States prices for processing apples for the years 1949-56 are revised to include States for which there are estimates of apples sold for processing. Beginning in January 1953 parity prices have been calculated for "apples for processing." In the earlier period, parity prices of apples for processing were calculated for "apples for canning," based on the 6 important canning States, and "apples for drying" based on prices in California.

#### PEARS

In the supplement to the April 1959 Agricultural Prices, the average prices for all sales, fresh and processing, in Oregon and Washington for the crops of 1955-58, were changed to the equivalent packinghouse-door returns basis, from the "as sold" formerly used. The United States price and value reflected this change. The equivalent packinghouse-door returns for all sales in Oregon and Washington are now comparable with California's equivalent returns for bulk fruit at first delivery point. Further, the "all sales" price represents a combination of the fresh and processing price series. This bulletin extends Oregon and Washington equivalent returns for all sales back to 1919, and the revised value of production and value of sales for the two States and the United States reflect these changes. The price and value statistics for other States are unchanged from previous publications, but are included here to bring together the entire series in one publication. November 15 prices were used for States other than Pacific Coast for years 1919-24.

#### SOURCE OF DATA

In the more commercialized fruit areas, large handlers of fruit, such as cooperatives, processors, and packing houses furnish the bulk of the basic data. In areas where production or sales of fruit are of relatively minor importance and where fruit is sold largely or entirely for fresh consumption, growers and local buyers are the principal sources of information. Wholesale, auction market, and f.o.b. shipping point prices have also been utilized where such information is available.

#### DEFINITION OF TERMS

In the following tables price data shown for States other than the three Pacific Coast States are the average prices farmers receive for their products on a local market basis, at the point of first sale commonly referred to as the "average price as sold." For example, if in a given State half of the fruit is sold f.o.b. packed by the growers, one-fourth sold as bulk fruit at the packinghouse door, and one-fourth sold retail or at roadside stands, then the "average price as sold" is a weighted average of the prices applicable to the three positions. The average price of fruit sold for processing usually applies to bulk fruit at the processing plant door, as most fruit sold directly by the grower for processing changes ownership at this point.

For the Pacific Coast States all prices are expressed as "equivalent returns." The pricing point for apples and pears for the Washington and Oregon is the equivalent packinghouse-door returns since this is the common basis upon which settlement is made with the grower in this area. Actual prices are adjusted to apply to returns at the packinghouse door. That is, the f.o.b. packed price is adjusted to the incoming packinghouse door by subtracting all costs that accumulate between the incoming packinghouse door and the f.o.b. local shipping point such as grading, packing, packing material, inspection fees, selling, and other costs. In California the equivalent return for bulk fruit at the first delivery point refers to an average return for picked fruit at the orchard, at a roadside delivery point, or delivered to the packinghouse door. This is reasonably comparable with the packinghouse-door return in Washington and Oregon. Equivalent on-tree returns are derived by subtracting costs of picking and hauling fruit to the packing house from the equivalent packinghouse-door returns.

The season average price for the United States is obtained by weighting State prices by quantities sold.

The value estimates cover the marketing season and should not be confused with cash receipts from these crops for a calendar year.

1/ Estimates of commercial apples refer to the total production of apples in commercial areas of each State.

2/ Equivalent packinghouse-door returns for Washington and Oregon, equivalent returns for bulk fruit at first delivery point for California, and average price as sold for other States. This series represents a change in the U. S. price as explained on page 3.

3/ Canning prices per ton by areas 1934-40 as follows:

Season	3 States- Pennsylvania, Maryland and Virginia	2 States- Washington and Oregon
1934	14.60	2.90
1935	8.30	2.90
1936	20.80	6.30
1937	10.40	2.10
1938	10.40	2.10
1939	10.40	2.50
1940	12.50	2.10

4/ For the U. S., prices for other processing and all processing for years 1949-56 are revised to include all States for which there are estimates of apples sold for processing. Prices prior to 1949 are based on the 13 important processing States of New York, Pennsylvania, Indiana, Illinois, Michigan, Maryland, Virginia, West Virginia, Arkansas, Idaho, Washington, Oregon, and California.

- 1/ Estimates of commercial apples refer to the total production of apples in the commercial areas of each State.  
 2/ Prices shown are for cider and vinegar only.  
 3/ Canning prices for 3-State area of Pennsylvania, Maryland, and Virginia and 2-State area of Washington and Oregon shown in footnote on page 5.  
 4/ Prices shown are for cider and vinegar only. Price per ton for other processing items for Virginia as follows:

	1936	1937	1938	1939	1940
	Dol.	Dol.	Dol.	Dol.	Dol.
Brandy and wine	6.00	5.00	4.00	5.00	4.60
Syrup, jelly, apple butter	9.20	5.20	5.40	6.00	5.40

- 5/ Prices not published because quantity negligible, or to avoid disclosing individual operations.  
 6/ Other processing excluding canning, freezing, and drying.  
 7/ Prices shown only for years for which separate utilization quantities are published.

1/ Estimates of commercial apples refer to the total production of apples in the commercial areas of each State.

2/ Season average price refers to crop of the designated year. The marketing season for apples for fresh consumption is June 1 to May 31 for Delaware, Maryland, Virginia, West Virginia, North Carolina, Indiana, Illinois, Missouri, Kentucky, Tennessee, Arkansas, and California; July 1 to June 30 for other States except Washington and Oregon where the bulk of the fruit from a given crop year is marketed in the 12-month period August 1 to July 31.

3/ Equivalent packinghouse-door returns for Washington and Oregon, equivalent returns for bulk fruit at first delivery point for California, and average price as sold for other States. The United States price is computed by weighting State prices or equivalent returns by quantities sold.

Table 5.--PEARS: Season average price received by growers, by utilization, and value, United States, and by States, 1919-56

1/ Equivalent packinghouse-door returns for fresh consumption for Pacific Coast States, as sold fresh price for Michigan and New York, and average price all sales for other States. 2/ Washington, Oregon, and California for years 1919-40; four States including Michigan, 1941-56. 3/ Dried basis, ratio 5.5 tons fresh equivalent to 1 ton dried. 4/ Equivalent packinghouse-door returns for Washington and Oregon, equivalent returns for bulk fruit at first delivery point for California, and average prices as sold for other States. This series represents a change in method of computing U. S. prices as explained on page 4. 5/ The same as the price series "all processing except dried". 6/ Prices not published in order to avoid disclosing individual operations. 7/ In some years includes returns not shown for small quantities processed as follows: Washington--Bartletts for drying and other than Bartletts for canning and for drying; Oregon--Bartletts crushed and other than Bartletts for canning and crushed; California--Bartletts frozen and crushed, and other than Bartletts crushed. 8/ Other than Bartlett and Hardy for California and other pears for Washington and Oregon.

1933	10.42	14.60	12.50	2.90	5.40	5.80	4.80	8.30	10.42	---	7.60

1/ Prices for 6 States weighted by sales to obtain U. S. average.

2/ Prior to January 1953 the parity price was computed for (1) apples for canning based on the 6-State canning price and (2) apples for drying based on the California drying price. Beginning in January 1953 the parity price is based on the U. S. series apples for processing.

APPENDIX I

Table D.--Apples--Total Crop: Monthly and season average price per bushel received by growers, United States, 1909-34

Year	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Season Average 1/
