and World Agricultural Outlook Board

HIGHLIGHTS

June 22 – 28, 2025

Highlights provided by USDA/WAOB

Active weather prevailed in the **southern Rockies** and many areas from the **Plains to the Atlantic Seaboard**, although highly variable rainfall totals led to flash flooding in a few spots and mostly dry conditions in others. Some of the heaviest rain fell in a partial “ring of fire” configuration from the **southern Rockies into the upper Midwest**, as monsoon-related moisture wrapped around western and northern periphery of a ridge of high pressure parked for several days over the **middle Atlantic States**. Closer to the

center of the stubborn ridge, showers were less widespread—and heat was more intense. The record-shattering heat propelled weekly temperatures at least 5 to 10°F above normal from the **southern and eastern Corn Belt into the middle Atlantic States and southern New England**. As the week progressed, an upper-level disturbance near the southern edge of the ridge contributed to locally heavy showers in the **eastern Gulf Coast region** and environs, including parts of **Florida**. Meanwhile, dry but seasonably cool weather covered most areas **west of the Rockies**. Despite the lack of extreme heat, several **Western** wildfires flared amid the dry weather and periods of gusty winds. Near the end of June, three active **Western** wildfires—two in **Utah** and one in **New Mexico**—had each burned between 10,000 and 50,000 acres of vegetation. Farther east, however, cloudiness and drought-easing showers contributed to cooler-than-normal conditions in the **southern Rockies**.

At the height of the **Eastern** hot spell, numerous June temperature records were tied or broken. **Plattsburg, NY**, tied an all-time station record on June 23 with a high of 101°F. On the 24th, June records were achieved in locations such as **Newark, NJ** (103°F); **Boston, MA** (102°F); and **New York's JFK Airport** (102°F). **JFK Airport** had never attained a triple-digit reading during June, with a previous peak of 99°F on June 30, 1964, and several earlier dates. **Augusta, ME**, also collected its first 100-degree reading in June, peaking at 100°F on the 24th. The only other instance of a reading of 100°F in **Augusta** was August 5, 1955. With a high of 101°F on June 24, **Philadelphia, PA**, noted its first triple-digit heat since July 18, 2012, and experienced its first 100-degree reading in June since 1994. **Georgetown, DE** (101°F on June 25), logged its earliest-ever temperature above the 100-degree mark, previously set with a high of 101°F on June 29, 2012. Uncomfortable heat continued through the overnight hours, with **Grand Rapids, MI**, failing to fall below 80°F on a June day for the first time on record. **Grand Rapids'** minimum temperature of 80°F, which occurred on June 22, supplanted the station's June record of 79°F, set on June 20, 1953. In **Wisconsin**, the 22nd featured the highest June minimum temperatures in locations such as **La Crosse** (80°F) and **Green Bay** (79°F). On June 23, lows of 79°F set or tied monthly records in **Alpena, MI**, and **Wallops Island, VA**. In contrast, chilly air briefly settled across the **West**. In **Nevada**, freezes and daily-record lows were observed on June 22 in locations such as **Eureka** (24°F), **Ely** (25°F), and **Winnemucca** (29°F). On June 23, record-setting lows dipped to 32°F in **Casper, WY**, and **Pocatello, ID**. From June 22-26, **Lake Yellowstone, WY**, reported five consecutive freezes, including a low of 26°F on the 24th.

Variable rain fell during the week nearly everywhere from the **Rockies eastward**. During the last 9 days of the month, rainfall totaled 3.06 inches in **Roswell, NM**, with most (3.08 inches)

falling from June 22-25. Similarly, 3.14 inches fell in **Clayton, NM**, from June 23-26, aided by a daily-record sum (2.14 inches) on the first day of the wet spell. Meanwhile, heavy rain also soaked the **upper Midwest**, where **Madison, WI**, collected a record-setting sum of 2.48 inches on June 23. Elsewhere in **Wisconsin**, **La Crosse** received 4.44 inches of rain from June 23-26. Thunderstorms also peppered the **Plains**, where daily-record amounts for June 24 reached 3.80 inches in **Imperial, NE**, and 1.55 inches in **Dalhart, TX**. On the 25th, **Grand Island, NE**, was inundated with 6.41 inches of rain, marking the wettest June day on record in that location (previously, 4.18 inches on June 15, 1990). In fact, the only wetter day in **Grand Island** was May 11, 2005, when 6.50 inches fell. Heavy rain also continued to pound the **upper Midwest** on June 25, when daily-record totals climbed to 2.31 inches in **Wausau, WI**, and 1.62 inches in **Mitchell, SD**. Late in the week, heavier showers shifted eastward, with daily-record totals being set in locations such as **Battle Creek, MI** (1.46 inches on June 27), and **Martinsburg, WV** (1.73 inches on June 28).

Locally significant precipitation fell across **interior and southeastern Alaska**. In **Bettles**, rainfall from June 23-26 totaled 0.81 inch. Meanwhile, **Juneau** received weekly rainfall totaling 1.69 inches, followed by an additional 1.17 inches on June 29. In areas where wildfires have been active, **Alaskan** rainfall aided containment efforts. Still, at least ten active **Alaskan** fires had burned more than 10,000 acres of vegetation apiece by the end of June, according to the National Interagency Fire Center. Farther south, June rainfall at **Hawaii's** major airport observation sites ranged from a trace in **Kahului, Maui**, to 5.38 inches (74 percent of normal) in **Hilo**, on the **Big Island**. However, parts of the state received significant, late-month rainfall. On **Kauai**, **Lihue** netted a weekly sum of 0.99 inch and a June total of 1.55 inches (87 percent of normal).

National Agricultural Summary

June 23 – 29, 2025

Weekly National Agricultural Summary provided by USDA/NASS

HIGHLIGHTS

During the last full week of June, much of the central and eastern U.S. experienced above-normal temperatures, with some areas reaching 8°F or more above average. Parts of the Great Plains and the middle and upper

Mississippi Valley received rainfall, improving soil moisture. In contrast, most of the Delta region recorded dry weather. The Pacific Northwest remained mostly dry throughout the week.

Corn: Eight percent of the nation's corn crop had reached the silking stage by June 29, two percentage points behind last year but 2 points ahead of the 5-year average. On June 29, seventy-three percent of the nation's corn was rated in good to excellent condition, 3 percentage points above last week. In Iowa, the largest corn-producing state, 85 percent of the corn crop was rated in good to excellent condition.

Soybeans: Nationally, 94 percent of the soybeans had emerged by June 29, equal to last year but 1 percentage point behind the 5-year average. Seventeen percent of the nation's soybean crop was blooming by the week's end, 1 percentage point behind last year but 1 point ahead of average. Nationally, 3 percent of the soybean crop had begun setting pods, equal to last year but 1 percentage point ahead of average. On June 29, sixty-six percent of the nation's soybean crop was rated in good to excellent condition, equal to last week.

Winter Wheat: Thirty-seven percent of the nation's winter wheat acreage had been harvested by June 29, fifteen percentage points behind last year and 5 points behind the 5-year average. Winter wheat harvest progress was behind the average pace in nine of the 18 estimating States. On June 29, forty-eight percent of the 2025 winter wheat crop was reported in good to excellent condition, 1 percentage point below the previous week. In Kansas, the largest winter wheat-producing state, 48 percent of the crop was rated in good to excellent condition.

Cotton: By June 29, producers had planted 95 percent of the nation's cotton crop, 2 percentage points behind last year and 3 points behind the 5-year average. Forty percent of the nation's cotton had reached the squaring stage by June 29, one percentage point behind last year but 3 points ahead of average. By June 29, nine percent of the cotton was setting bolls, 2 percentage points behind last year but equal to the average. On June 29, fifty-one percent of the 2025 cotton acreage was rated in good to excellent condition, 4 percentage points above last week.

Sorghum: Nationally, 92 percent of the sorghum was planted by June 29, three percent points behind last year and 2 points behind the 5-year average. By week's end, 18 percent of the nation's sorghum had reached the headed stage,

1 percentage point behind last year and 2 points behind average. On June 29, sixty-four percent of the nation's sorghum was rated in good to excellent condition, 3 percentage points above last week.

Rice: By June 29, nineteen percent of the nation's rice had reached the headed stage, 2 percentage points ahead of last year and 5 points ahead of the 5-year average. On June 29, eighty percent of the rice acreage was rated in good to excellent condition, 2 percentage points above the previous week.

Other Small Grains: Nationally, 74 percent of the nation's oat crop had headed by June 29, two percentage points ahead of both last year and the 5-year average. On June 29, sixty-one percent of the oat crop was rated in good to excellent condition, 4 percentage points above the previous week.

By June 29, ninety-six percent of the nation's barley crop had emerged, 3 percentage points behind both last year and the 5-year average. Thirty-five percent of the barley had reached the heading stage by week's end, 1 percentage point ahead of last year but 2 points behind average. On June 29, forty-three percent of the barley acreage was rated in good to excellent condition, 1 percentage point above last week.

Ninety-six percent of the nation's spring wheat crop had emerged by June 29, four percentage points behind both last year and the 5-year average. Thirty-eight percent of the spring wheat had reached the headed stage by week's end, 3 percentage points ahead of last year and 1 point ahead of average. On June 29, fifty-three percent of the spring wheat acreage was rated in good to excellent condition, 1 percentage point below last week.

Other Crops: Forty-one percent of the nation's peanut crop had reached the pegging stage by June 29, one percentage point behind last year but 2 points ahead of the 5-year average. On June 29, seventy-two percent of the peanut acreage was rated in good to excellent condition, equal to last week.

By June 29, producers had planted 97 percent of this year's sunflower crop, 1 percentage point ahead of both last year and the 5-year average. Producers in North and South Dakota had planted 98 percent of their respective crops.

Crop Progress and Condition

Week Ending June 29, 2025

International Weather and Crop Summary

June 22 – 28, 2025

International Weather and Crop Highlights and Summaries provided by USDA/WAOB

HIGHLIGHTS

EUROPE: Hot and dry weather expanded eastward across southern portions of the continent, while showers and thunderstorms continued in central and northern Europe.

WESTERN FSU: Below-normal temperatures prevailed across the region, with widespread rain from northern and eastern Ukraine into Russia contrasting with dry conditions over southwestern croplands.

EASTERN FSU: Widespread showers and cooler temperatures across northern Kazakhstan and central Russia favored vegetative spring grains, while seasonably sunny and hot conditions favored cotton development in central Uzbekistan and environs.

MIDDLE EAST: Mostly dry and hot weather in Turkey promoted winter grain harvesting but hastened summer crops toward or through reproduction.

SOUTH ASIA: Monsoon rainfall covered much of the region, supporting kharif crop planting in India.

EAST ASIA: Beneficial rain aided summer crops in southern China, while the North China Plain continued to suffer from above-normal temperatures.

SOUTHEAST ASIA: Thailand and surrounding regions received beneficial seasonal rain, while parts of Cambodia, Malaysia, and Indonesia experienced drier conditions.

AUSTRALIA: Early-week showers in eastern Australia eased dryness and improved soil moisture for emerging to vegetative winter crops, though long-term drought persisted.

MEXICO: Tropical showers and an active monsoon circulation fueled widespread rain from the southern plateau corn belt into southeastern Mexico.

CANADIAN PRARIES: Mostly light showers and near- or slightly below-normal temperatures generally favored summer crop growth, although pesky dry pockets persisted.

SOUTHEASTERN CANADA: Very warm weather, occasional showers, and ample soil moisture reserves promoted a rapid pace of crop development.

EUROPE
Total Precipitation(mm)
June 22 - 28, 2025

Station precipitation reports from France and Hungary are either missing or suspect.

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

EUROPE

Increasingly dry and hot weather expanded eastward across southern portions of the continent, while showers continued in central and northern Europe. A strengthening area of high pressure maintained hot conditions in Spain (35-38°C in the north, 38-43°C in the south), though showers (1-15 mm) associated with a weak disturbance during the middle of the week provided temporary heat relief. Flowering cotton in southern Spain (Andalucia) was subjected to temperatures as high as 43.5°C, while late-vegetative corn in northern Spain experienced daytime maxima topping 38°C. Very high daytime temperatures (35-38°C) in France and northern Italy accelerated summer crops toward reproduction in the former and stressed tasseling corn in the latter's Po River Valley. Nevertheless, mid-week showers also provided temporary heat relief in western and northern France*, though temperatures quickly rebounded to above-normal levels at the end of the monitoring period. Abnormal warmth (3-6°C above normal, highs in the lower to middle 30s degrees C) prevailed in England, the Low

Countries, and Germany, accelerating winter crop drydown and harvesting as well as spring grain and summer crop development. However, showers and thunderstorms (5-35 mm) across central and northern Europe helped mitigate the impacts of the unusual heat. Extreme heat expanded eastward into the Balkans, where daytime highs ranging from 35 to 39°C hastened corn, soybeans, and sunflowers toward reproduction. Showers in southeastern Europe were spotty, with the heaviest (5-35 mm) falling in south-central and northeastern Romania. Daytime highs likewise approached or topped 40°C in Greece under mostly sunny skies, hastening the development of irrigated cotton. Despite the overall hot weather pattern, somewhat cooler and showery conditions (10-50 mm) favored filling winter crops in Poland and the Baltic States.

**Surface-based weather station data from France and Hungary were either missing or suspect; radar and satellite data were used to augment the analysis.*

WESTERN FSU
Total Precipitation(mm)
June 22 - 28, 2025

Data availability may be affected by the current geopolitical situation in Ukraine

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

WESTERN FSU

Chilly and showery conditions prevailed across much of the region save for drier and warmer southwestern crop areas. Following the passage of strong cold front during the preceding week, temperatures during the monitoring period averaged 2 to 4°C below normal from northern and eastern Ukraine into Russia. The chilly air slowed winter crop maturation and drydown as well as the development of vegetative summer crops. Widespread moderate to heavy showers (10-65 mm) over these same croplands maintained adequate to

abundant soil moisture for crop development, especially in west-central Russia where rain was heaviest. However, dry and warm weather (30-34°C) in Moldova and southwestern Ukraine promoted winter crop maturation and drydown as well as vegetative summer crop growth. Localized dryness (5 mm or less) also prevailed adjacent to the central and eastern of the Black Sea Coast, though moisture supplies remained good to excellent in southeastern Ukraine and southern Russia following a wet latter half of June.

EASTERN FSU
Total Precipitation(mm)
June 22 - 28, 2025

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

EASTERN FSU

Continued wet but cooler weather in the north contrasted with seasonably hot and mostly dry conditions in the south. A strong cold front brought below-normal temperatures (1-3°C below normal) to much of the spring grain belt of central Russia and northern Kazakhstan, with anomalous warmth (up to 3°C above normal) confined to East Kazakhstan and southern portions of Russia's Siberia District. The front's slow movement netted much of northern Kazakhstan and central Russia 10 to 70 mm of rainfall (locally more), although pockets of lighter rain (5 mm or less) were noted from Qostanay, Kazakhstan eastward into Novosibirsk, Russia. Spring grains were

mostly still vegetative, but barley was approaching the heading stage of development in western growing areas. Farther south across the Commonwealth of Independent States (CIS), seasonably sunny skies and near- to above-normal temperatures (locally up to 3°C above normal) accelerated the development of flowering cotton, though cooler temperatures during the latter half of the week eased potential heat stress. However, another round of unusual showers (5-40 mm) in Kyrgyzstan further eased irrigation requirements in eastern croplands. Cotton was developing on par with normal across most of the CIS but up to 5 days ahead of normal in southern Kazakhstan.

MIDDLE EAST
Total Precipitation(mm)
June 22 - 28, 2025

Weather station data for Syria, Iraq, and Iran were not available for this week's analysis.

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

MIDDLE EAST

Dry and hot weather prevailed across the region. Sunny skies and above-normal temperatures in Turkey (2-5°C above normal) favored winter grain harvesting and accelerated the development of corn, sunflowers, and cotton. Extreme heat (36-43°C) in western Turkey's Aegean Region accelerated cotton through the squaring stage of development, while daytime maxima in the upper 30s and lower 40s (degrees C) in southeastern

Turkey (Adana and GAP Regions) maintained high irrigation demands for flowering cotton as well as tasseling corn. Dry and hot weather continued across the remainder of the region*, facilitating wheat harvesting and other seasonal fieldwork.

**Surface-based weather station data from Syria, Iraq, and Iran were not available; satellite data were used to augment the analysis.*

SOUTH ASIA
Total Precipitation(mm)
June 22 - 28, 2025

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

SOUTH ASIA

The Southwest Monsoon spread across nearly the entire region, bringing extensive rainfall. Most areas experienced heavy to extremely heavy precipitation (up to 400 mm). This was beneficial for key rice production areas which received between 25 and 200 mm of rain, with some locations receiving higher amounts. In contrast, southeastern India received little to no rain,

causing drier conditions. Temperatures throughout the region continued to be slightly lower than in previous weeks, averaging in the lower to upper 30s (degrees C) due to the widespread showers. In Pakistan, moderate to heavy monsoon showers (10-100 mm) were recorded, resulting in normal to above-normal temperatures (1-3°C above normal) for that area.

EASTERN ASIA
Total Precipitation(mm)
June 22 - 28, 2025

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

EASTERN ASIA

Monsoon rainfall persisted across southern China, extending eastward across the East China Sea and into Japan. While rainfall amounts generally ranged from 25 to 200 mm, aiding summer crops south of the Yangtze River, some locations saw intense downpours that produced up to 300 mm, potentially causing flooding in affected areas. In contrast, the North China Plain saw only scattered showers (10-50 mm) that provided limited relief

from persistent above-normal temperatures, which averaged in the middle to upper 30s (degrees C) and could negatively impact crop growth. The northeast region received little to no rainfall and persistently warm temperatures, averaging 1 to 6°C above normal. Elsewhere in the region, the Korean Peninsula received moderate to heavy rainfall (10-80 mm), with daytime highs around the lower to middle 30s.

**SOUTHEAST ASIA**

Monsoon showers were widespread in the northern regions, averaging 25 to 100 mm with some locales reporting up to 300 mm. These included rain-fed rice areas in northeastern Thailand and key rice areas in the northern Philippines, where the substantial rainfall benefited crop growth. In contrast, other

parts of the region experienced insufficient seasonal rains (less than 25 mm), limiting moisture needed for rice and other crops. Near-normal temperatures prevailed across the region, with daytime highs in the middle to upper 30s (degrees C) and nighttime lows in the lower to middle 20s.

AUSTRALIA
Total Precipitation(mm)
June 22 - 28, 2025

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

AUSTRALIA

Early-week showers in southern and eastern Australia contrasted with mostly dry weather in western portions of the country. A strong cold front triggered light to moderate showers (2-25 mm) from South Australia eastward into Victoria and southern New South Wales, while heavier rain (25-90 mm) fell south and east of primary winter crop areas. The rainfall eased drought and improved soil moisture for winter crop emergence and establishment, though significant long-term deficits lingered. In fact, the

latest satellite-derived Vegetation Health Index (VHI) was the lowest on record for this time of year in both South Australia and Victoria, while the VHI in New South Wales transitioned from very poor in the south to excellent near the Queensland border. Behind the front, chilly temperatures (nighttime lows at or below freezing) settled over much of eastern Australia. A broad area of high pressure provided dry weather to Western Australia, facilitating seasonal fieldwork and vegetative winter crop development.

MEXICO
Total Precipitation(mm)
June 22 - 28, 2025

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

MEXICO

Showery weather from the southern plateau corn belt into southeastern Mexico supported summer crop development. Weekly rainfall totals from 25 to 100 mm were common across those regions, while temperatures averaged as much as 2°C below normal. Meanwhile, locally heavy showers continued in the Gulf Coast States, including Veracruz, following the previous week's torrential rainfall. As the week ended, the approach of Tropical Storm Barry further enhanced

rainfall in portions of the Gulf Coast region. Meanwhile, the North American monsoon circulation became more fully established, helping to draw moisture northward into some of northern Mexico's hardest-hit drought areas. However, given the long-term nature of the drought and the region's reliance on already-depleted irrigation reserves for agricultural production, any meaningful rangeland and crop recovery will require a protracted period of wet weather.

CANADIAN PRAIRIES

Total Precipitation(mm)

June 22 - 28, 2025

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

CANADIAN PRAIRIES

Rainfall across the Prairies generally totaled 25 mm or less, with higher amounts mostly limited to scattered locations in Saskatchewan. However, some of Saskatchewan's higher rainfall totals occurred in northern crop production areas that have been experiencing Moderate to Extreme Drought (D1 to D3), according to the latest Canadian Drought Monitor. As the week began, cropland topsoil moisture in Saskatchewan was rated 20 percent very short to short,

according to a provincial report, despite recent severe thunderstorms that resulted in localized wind and hail damage. Meanwhile, parts of the southern Prairies received minimal rainfall, particularly across southern Alberta, southwestern Saskatchewan, and southern Manitoba. Prairie temperatures as much as 2°F below had a nominal impact on crop development, although widespread minimum readings below 5°F were reported across the western half of the region.

SOUTHEASTERN CANADA

Total Precipitation(mm)

June 22 - 28, 2025

CLIMATE PREDICTION CENTER, NOAA
Computer generated contours
Based on preliminary data

SOUTHEASTERN CANADA

Unusually warm weather, with temperatures averaging as much as 5°C above normal and peaking near 35°C in areas away from the Great Lakes, promoted winter wheat maturation and a torrid pace of summer crop development. Provincial reports indicated that warmth has greatly helped to reduce heat-unit deficits and has accelerated the

development of later-planted crops. Despite the warmth, frequent showers maintained mostly favorable soil moisture reserves and even resulted in some fieldwork delays. Rainfall amounts were highly variable, broadly ranging from 10 to 50 mm, except for totals less than 10 mm north of Lake Ontario and in parts of southern Quebec.

U.S. Acreage Highlights

The following information was released by USDA's Agricultural Statistics Board on June 30, 2025.

Corn planted area for all purposes in 2025 is estimated at 95.2 million acres, up 5 percent or 4.61 million acres from last year. This represents the third-highest U.S. planted acreage since 1944. Compared with last year, planted acreage is expected to be up or unchanged in 41 of the 48 estimating states. Area harvested for grain, at 86.8 million acres, is up 5 percent from last year.

Soybean planted area for 2025 is estimated at 83.4 million acres, down 4 percent from last year. Compared with last year, planted acreage is down or unchanged in 25 of the 29 estimating states.

All wheat planted area for 2025 is estimated at 45.5 million acres, down 1 percent from 2024.

The 2025 winter wheat planted area, at 33.3 million acres, is down less than 1 percent from last year but up

slightly from the previous estimate. Of this total, about 23.6 million acres are Hard Red Winter, 6.10 million acres are Soft Red Winter, and 3.67 million acres are White Winter.

Area planted to other spring wheat for 2025 is estimated at 10.0 million acres, down 5 percent from the 2024 estimate. Of this total, about 9.44 million acres are Hard Red Spring wheat.

Durum planted area for 2025 is estimated at 2.11 million acres, up 2 percent from the previous year.

All cotton planted area for 2025 is estimated at 10.1 million acres, down 10 percent from last year. Upland area is estimated at 9.95 million acres, down 9 percent from 2024. American Pima area is estimated at 171,000 acres, down 17 percent from 2024.
