1953 OUTLOOK ISSUE
FOR RELEASE SEPT. 10, A. M.

THE

Wheat

SITUATION

BUREAU OF AGRICULTURAL ECONOMICS
UNITED STATES DEPARTMENT OF AGRICULTURE

WS-130

BAC

AUG. - SEPT. 1952

Wheat supplies in 1952-53 are estimated at 1,577 million bushels, the third largest of record. Stocks of old crop wheat on July 1, 1952 were 254 million bushels and the crop was estimated as of August 1 at 1,298 million. It is estimated that about 25 million bushels of feeding-quality wheat may be imported.

Continental domestic wheat uses are expected to total about 688 million bushels in 1952-53. If exports (including shipments to Territories) and military purchases total about 340 million bushels, the carry-over July 1, 1953 would be about 550 million bushels, which would be well above the 1945-50 average of 232 million, and more than double the 254 million of mid-1952.

DOMESTIC USES OF WHEAT

U. S. DEPARTMENT OF AGRICULTURE

NEG. 46050-XX

BUREAU OF AGRICULTURAL ECONOMICS

Total domestic use of wheat in 1952-53 is expected to be slightly above the quantity used in 1951-52. Food and seed may be about the same, with some increase in the quantity fed to livestock. Only insignificant quantities will be used industrially.

THE WHEAT SITUATION
- Including Rye -

... Approved by the Outlook and Situation Board, August 26, 1952

SUMMARY

Wheat supplies in prospect for this year and next probably will exceed domestic and export requirements and increases in the year-end carry-over stocks are expected for the 1952-53 marketing year and probably also for the 1953-54 year. This year, supplies are estimated to be the third largest in history and the carry-over next July 1 is expected to be about double the 254 million bushels of mid-1952.

The national wheat production goal for the 1953 harvest calls for 72 million seeded acres. This compares with 77.5 million acres seeded for the 1952 crop and the 1942-51 average of 70.6 million acres. Average yields on this goal acreage would result in a crop of about 1,080 million bushels. This would be enough to meet anticipated export and domestic requirements and probably add some to reserves on July 1, 1954. In some years growers have exceeded the acreage goals. If goals are exceeded in 1953 the increase in wheat supplies, at average yields, would add to the July 1, 1954 carry-over about 15 million bushels for each additional one million acres seeded.

During the current marketing year, prices of wheat are expected to average slightly below the effective loan level -- the support price of \$2.20 minus a storage deduction. Cash wheat prices have advanced since late June but are expected to continue generally below the effective support until late fall or early winter. Recent legislation provides for mandatory 90 percent of parity support prices again for the 1953 crop, which means that wheat prices in 1953 may not be much different than those now being realized.

World trade in wheat may be down about 5 percent from the high level of 1951-52, with exports from Canada larger and those from the United States smaller. Exports from Australia and Argentina are expected to continue at low levels. Countries other than the four principal exporters may increase their exports moderately.

Prospects for the 1952-53 breadgrain crops of the world, excluding the Soviet Union and China, point to a somewhat larger outturn than the good 1951-52 harvest, and a new record may even be established. An increase of about 400 million bushels of wheat is reported for North America. The outlook for Europe is generally favorable and an increase over 1951 is expected in countries for which reports are available. Conditions in the Soviet Union have not been entirely favorable and some damage to winter grains appears to have taken place. Conditions in Asia appear mostly favorable, and point to an even better harvest than the large one of last year. An increase of about 15 percent over 1951 in the Northern Hemisphere countries of Africa is in prospect. Conditions in Argentina were favorable at the beginning of the growing season, but prospects in Australia are less favorable than in 1951-52.

The national goal for rye, for harvest as grain, in 1953 is 1.7 million acres. In most years, the acreage harvested has been substantially below the announced goals. However, since the production has now reached such a low level and prices have advanced, it is probable that the acreage harvested in 1953 will more nearly approximate the goal than in past years. If the goal acreage is harvested and average yields are obtained, about 21 million bushels would be produced, compared with 21.3 million in 1950 and 21.4 million in 1951. A crop of this size would meet domestic requirements and hold the carry-over on July 1, 1954 at about 1952 level.

THE OUTLOOK FOR WHEAT IN 1953-54

BACKGROUND.-- Unusually large exports of breadgrains absorbed more than the excess over domestic needs for the billion-bushel wheat crops produced annually in the United States in 1944-48. Large United States exports also have held down the increase in the size of the carry-over since then (table 6). Exports of wheat during the marketing years 1945-46 through 1948-49 averaged 444 million bushels, but declined to 299 million bushels in 1949-50. Largely as a result of the war in Korea and reduced availability in other exporting countries, exports from the United States in 1950-51 increased to 366 million bushels. In 1951-52 they reached 473 million bushels, reflecting small exports from Southern Hemisphere countries and unusually large takings by India and France.

Production in 1953 Expected
To Meet Requirements and
Probably Add to Carry-over

A national goal of 72 million seeded acres for the 1953 wheat crop was announced on July 16. This is about 8 percent below the big acreage seeded for harvest this year, but above the 1942-51 average of 70.6 million acres (table 4). With average yields of 15 bushels per seeded acre ^{1/}, this goal acreage would result in a crop of about 1,080 million bushels of wheat, and would meet all anticipated requirements for the marketing year, both domestic and export, and probably add some to reserves.

With a carry-over of old wheat on July 1, 1953 estimated at about 550 million bushels, the total supply of domestic wheat for 1953-54 would be about 1,630 million bushels. Imports are expected to be small, possibly only about 5 million bushels, mostly of feeding-quality grain.

Domestic disappearance in 1953-54 is forecast at about 695 million bushels, consisting of 505 million bushels for civilian (continental and territorial) and military food, 85 million bushels or less for seed, and 105 million for feed. This would leave about 940 million bushels for exports and carry-over. Assuming exports at 300 million bushels (they seem likely to be within a range of 250 million to 350 million, compared with 473 million in 1951-52), the carry-over July 1, 1954 would be about 640 million bushels, or about the same as the large carry-over in 1942. Even if exports should be as much as 400 million bushels, the carry-over would be about 540 million bushels.

In some years growers have exceeded the goals. If goals are exceeded in 1953, the increase in wheat supplies, at average yields, would add to the July 1, 1954 carry-over about 15 million bushels for each additional one million acres seeded.

Commenting on the goal acreage, the Secretary of Agriculture said: "The

^{1/} Yields per seeded acre for 1942-51 averaged 15.5 bushels and for 1947-51, 14.8 bushels.

large 1952 crop makes it possible to establish a production level for 1953 which is below that of recent years. The goal for 1953, however, is kept on the side of abundance to play safe in the mobilization period. The goal also recognizes that wheat, being a universal grain, may be substituted for other grains in case an emergency should arise requiring such use of wheat."

In late June, the Secretary announced that there would be no wheat acreage allotments or marketing controls for 1953 in view of the uncertainty of world conditions.

The support level for the 1953 crop will be announced in the near future. It is expected that it will be not less than about \$2.20 per bushel, which is 90 percent of the July 15, 1952 wheat parity price of \$2.45, and the same as the final rate for the 1952 crop. Recent legislation provides for mandatory 90 percent of parity support prices again for the 1953 crop.

Exports in 1953-54 Expected to be Reduced

Exports in 1953-54 may be between 250 and 350 million bushels, which is sharply below the near-record 473 million of 1951-52. Exports last season were increased by reduced availability of wheat of export quality in Canada, and small crops in Australia and Argentina. In the latter nation, the crop was not even large enough to satisfy domestic requirements. The prospective all-time record Canadian crop in 1952 assures large supplies in 1953-54. Moreover a much larger crop is probable in Argentina than was harvested in January 1952.

The present International Wheat Agreement ends with the 1952-53 marketing year. Under it we have a quota of about 250 million bushels a year. A renewal of the Agreement is being considered, with resumption of negotiations now scheduled for Washington in mid-January. The final outcome of negotiations will have an important bearing on our wheat export program for the 1953-54 year.

Wheat Supplies Third Largest in Our History: Carry-over July 1, 1953 Likely To Be About 550 Million Bushels

Total wheat supplies for the marketing year which began July 1, 1952 are now estimated at 1,577 million bushels. This consists of the carry-over July 1, 1952 of 254 million bushels $\frac{4}{7}$, the crop estimated as of August 1 at 1,298 million and likely imports of about 25 million of wheat for live-stock feeding. Despite the poor spring wheat crop, total supplies are the third largest in our history. In 1942-43, when the carry-over was 631 million bushels, supplies totaled 1,601 million bushels. In 1943-44, when the carry-over was 619 million bushels and imports 136 million, supplies totaled 1,599 million bushels.

Domestic disappearance in 1952-53 may total about 700 million bushels, compared with about 688 million in 1951-52. Civilian and military food use (including use by territories of the United States) is expected to be about $\frac{4}{7}$ Of the total carry-over, about 140 million bushels were owned by CCC.

500 million bushels, about the same as in 1951-52. Civilian food use in 1951-52 averaged 188.6 pounds of wheat per capita compared with 189.4 pounds in 1950-51, and 201.2 in 1945-49 (table 12). Feed use of wheat may total about 115 million bushels, slightly above the estimate for 1951-52. About 88 million bushels will be used for seed, about the same as in 1951-52. Use for alcohol and spirits will again be insignificant.

A domestic disappearance of 700 million bushels would leave about 875 million bushels for export and carry-over. Assuming exports of about 325 million bushels, about 550 million bushels would remain for a carry-over July 1, 1953. This would be above the 1942-51 average of 335 million, but well below the record 631 million in 1942.

THE CURRENT WHEAT SITUATION

BACKGROUND.- In 1945-50, the average supply of wheat in continental United States was 1,407 million bushels (15 percent above the 1,226 million bushels 1936-45 average), consisting of a carry-over of old wheat, 232; production, 1,172, and imports for domestic use, 3. Total disappearance averaged 1,155 million bushels, consisting of food, 485; including 4 to U. S. Territories; feed, 161; seed, 87; and exports, 418. Use for alcohol was only 0.4 million bushels. Carry-over stocks at the end of this period were much larger than at the beginning reflecting large crops during the period. (table 6).

Wheat prices to growers advanced from an average of 67 cents per bushel in 1940-41 to a record season average of \$2.29 for the 1947 crop. The highest monthly price was \$2.81 in mid-January 1948. From 1938 to late 1944 the level of the loan rates under the support programs, which reflected the general rise in prices farmers pay, was an important factor in domestic wheat price. From 1942 through 1945 wheat feeding was exceptionally heavy and large quantities of wheat were used for industrial purposes. Beginning in early 1945, export demand, influenced by the various foreign aid programs, became a very important price factor.

In 1947-48, wheat prices reflected strong demand for U. S. wheat resulting from short crops in many importing countries. With the harvest of the near-record crop in 1948 and relatively large crops in importing countries the loan program again became an important price factor along with the large export demand. The price to growers for the 1948-49 crop averaged about 1 cent below the \$2.00 loan level, in 1949-50 about 7 cents under the \$1.95 loan, in 1950-51 about 1 cent above the \$1.99 loan, and in 1951-52, when storage charges on loans were first assumed by farmers, the price was about 7 cents under the loan.

1952 Production Second Largest on Record: Durum Crop Small

The 1952 crop of all wheat, estimated as of August 1 at 1,298 million bushels, has been exceeded only by the 1,359 million bushels in 1947.

The 1951 crop was 987 million bushels and the 1941-50 average 1,085 million bushels. Winter wheat harvest proceeded rapidly under satisfactory to ideal conditions and was virtually completed by August 1, except in the Northwest. Harvesting losses were reduced to a minimum, which helped to improve yields. The crop, currently estimated at nearly 1,063 million bushels, is the largest of record. After getting off to a poor start, spring wheat prospects improved in almost all areas, with harvest well underway on August 1. Late June and July rains in the Montana-Dakota area enabled heads to fill well and improved prospects for the late-planted acreage. On August 1 rust was still a threat to durum and late-sown acreages. The outturn of spring wheat was expected to reach 236 million bushels.

The 1952 yield of all wheat is estimated at 16.7 bushels per seeded acre, compared with 12.7 bushels in 1951, and the 1941-50 average of 15.8 bushels. The 77.5 million acres seeded to wheat in the fall of 1951 and the spring of 1952 is slightly less than the 78.1 million acres seeded a year earlier. Seedings of spring wheat were about 280 thousand acres below intentions, chiefly because of less durum in North Dakota and less other spring wheat in Montana.

The prospective total 1952 crop consists of the following, in million bushels (1951 in parentheses): hard red winter 715 (376), soft red winter 204 (151), hard red spring 176 (262), durum 24 (36), and white, both winter and spring seeded, 179 (162).

The durum crop is the smallest since 1936. However, substantial old-crop stocks on hand July 1, 1952 of 18 million bushels makes total supplies for the marketing year 42 million bushels. As far as quantity is concerned this is ample to satisfy domestic requirements, which in 1946-50 averaged about 30 million bushels (table 10). There is always the question of the proportion of red durum and off quality durum in the quantity figures. Early season marketings this year are of the best milling quality in years, with color excellent. New crop inspections graded thus far show practically all cars grading Hard Amber Durum or Amber Durum and No. 2 grade or better. The 1951 crop contained considerable poor milling-quality grain. 5/ Exports during 1952-53 will be small, as a result of higher prevailing prices and smaller supplies compared with 1951-52.

Wheat Prices Advance: Still Mostly
Below Effective Loan Levels

Cash wheat prices have continued to advance during the past month, although there have been some slight weakening recently. On August 26, the price of No. 2 Hard Winter (ordinary protein) at Kansas City, was \$2.31, 17 cents under the gross loan of \$2.48, or 7 cents under the net loan after deducting 10 cents for storage. 6/ The price on August 26 was about

5/ Only 12 percent of the receipts at Minneapolis in the September-June period graded Hard Amber Durum and 20 percent Amber Durum, while 62 percent fell into the ordinary Durum classification.

6/ Storage charges deductible for deposit period indicated are as follows: For Area 1, which includes the Pacific Northwest, 9 cents per bushel for August 19 to September 17. Area 2, which includes the Spring Wheat States, 10 cents for August 9 to September 7. Area 3, which includes Kansas, Missouri, and Nebraska, 10 cents for August 24 to September 22. Area 4, which includes Texas and Oklahoma, 11 cents for August 9 to September 7.

17 cents above the low point on June 28. On August 26, No. 1 Dark Northern Spring (ordinary protein) at Minneapolis was \$2.35, 16 cents under the gross loan of \$2.51, or 6 cents above the effective loan. 4/ The price of No. 1 Soft White at Portland at \$2.36 was 1 cent above the effective loan, but the price of No. 2 Soft Red at St. Louis, even after advancing about 11 cents from the low on June 30, was still about 17 cents under the effective loan. The price advance reflects the large movement of wheat into storage very early in the marketing season. Prices, however, may continue generally below effective loan level until at least late fall or early winter. The quantity placed under the support programs from the 1952 crop is expected to exceed the record 408 million bushels in 1942. Prices for the 1952-53 marketing year are expected to average slightly below the effective loan level -- the support price of \$2.20 minus a storage deduction.

THE CURRENT WORLD WHEAT SITUATION

BACKGROUND. - On July 1, 1943, stocks of wheat in the 4 principal exporting countries, United States, Canada, Australia and Argentina, were a record of 1,737 million bushels, almost 4 times the 1935-39 average of 458 million. By July 1945, however, they were down to 818 million bushels, and by July 1946 they had been further reduced to 387 million. Greatly increased disappearance was caused by wartime depletion of food supplies in importing countries and by poor crops in many areas. Stocks in the 4 countries on July 1, 1946 were the smallest since 1938 and about 16 percent less than the 1935-39 average. By July 1951 these stocks had increased to 816 million bushels. However, on July 1, 1952 they were reduced to 639 million (table 13).

World Trade in Wheat in 1952-53 May Be Down By About 5 Percent

World trade in wheat (including flour) in 1951-52 is estimated at about 990 million bushels, excluding 30 million bushels of feeding quality Canadian wheat shipped to the United States. This is above the 825 million in 1949-50 and the 906 million in 1950-51, and approximately the same as in the peak year of 1948-49.

In 1952-53, world trade may be down by about 5 percent, according to preliminary estimates. [The supply position in India is much improved and stocks in some European countries are larger than in recent years as a result of heavy imports in 1951-52. Exports from Canada, excluding feed wheat to the United States, probably will exceed the 360 million bushels in 1945-46. Exports from the United States may fall within the range of 300 million to 350 million, compared with 473 million in 1951-52. Exports from Australia and Argentina may not exceed the approximate 130 million in 1951-52, while exports from other areas may be around 100 million bushels, about 25 million above a year earlier. The larger crops in prospect for France, French North Africa, and Turkey, would permit sizeable exports from these countries.]

July 1 Wheat Stocks in Four Exporting Countries Down 22 Percent But Still Above Average

Wheat stocks in the four principal wheat exporting countries -- United States, Canada, Australia, and Argentina -- on July 1, 1952 totaled 639 million bushels, 177 million or 22 percent below the 816 million a year earlier

(table 13), and only 37 percent of the peak of 1,737 million bushels reached in 1943. Stocks this year, however, are still 40 percent above the 1935-39 average of 458 million bushels.

Canada was the only country of the four which showed an increase in stocks in the past year. Decreases for the other three countries were as follows: United States, 142 million; Argentina, 50 million; and Australia, 20 million.

Rye stocks in the United States, Canada and Argentina totaled 19 million bushels on July 1, 1952, compared with 26 million a year earlier and the 1945-49 average of 20 million. Production in Australia is small and stocks negligible. Rye stocks by countries in million bushels, were as follows (1951 in parentheses): United States, 4 (5); Canada, 10 (6); and Argentina, 5 (15).

World Breadgrain Prospects Promising 7/

Prospects for the world 1952-53 breadgrain crops excluding the Soviet Union and China, point to a somewhat larger outturn than the good 1951-52 harvest. Based on preliminary reports of a very good harvest in Northern Hemisphere countries and assuming near-average crops in important producing Southern Hemisphere countries, world breadgrain production in 1952 may even establish a new record.

An increase of about 400 million bushels is reported for North American. A net increase in harvests of exporting countries in the Southern Hemisphere is probable. In Argentina, one of the leading exporting nations, the crop last year was a virtual failure.

Prospects for better harvests than in 1951 for western European and Near East countries point to reduced import needs in those areas. Reports for France, Italy and Western Germany indicate a total increase of about 50 million bushels over the 1951 harvests. Reports from Turkey, Iran, and Syria show increases which more than offset reductions reported for India and Pakistan. The reduction in the latter countries, together with the current scarcity of rice, makes continued need for substantial wheat imports into that area apparent.

The present outlook is for a record wheat crop in North America. The United States crop, estimated at 1.3 billion bushels, as of August 1, is 311 million bushels larger than the 1951 crop. Wheat production in Canada is officially forecast at the all-time-record figure of 656 million bushels. This compares with the previous record of 567 million in 1928 and with last year's near-record production of 562 million. Of the total forecast, 635 million bushels are spring wheat and 21 million winter wheat. Unusually favorable growing conditions make the present outlook for record or near-record yields. The season is about 2 weeks early, and harvesting was making good progress at latest report.

Rye production in North America is small and is expected to approximate the 1951 levels, with a decline in the United States crop offsetting a larger outturn in Canada.

7/ From Foreign Crops and Markets, August 25, 1952 published by the Office of Foreign Agricultural Relations, USDA.

The breadgrain outlook for Europe is generally favorable, and an increase over the 1951 harvest is expected in countries for which reports are available. France, Italy, Western Germany and Sweden are the principal countries reporting increases. The outlook is also promising in Spain. Official estimates indicate that the wheat crop may be at the high level of 1951 and that rye production will be larger.

Reports from eastern and central Europe are limited. There is some evidence of damage from drought in Danube Basin countries, especially in Yugoslavia. Damage to winter grains is, however, much less than that to late crops. The extent of crop damage which may have resulted from cold weather in late May and early June is still uncertain.

Some damage to winter grains in the Soviet Union appears to have taken place. The season is late, with delayed seeding and retarded growth indicated for many regions. There have been reports of considerable lodging of grain which would complicate harvest operations. Difficulties of combine harvesting were reported from a number of regions. However, harvesting weather was good in the latter part of July and early August.

The present outlook in Asia is for an even better harvest than the large one of last year. Increases are expected in all reporting Near East countries, with the harvest in Turkey expected to exceed the 1951 record. Stocks are relatively large and, Turkey will have substantial quantities for export. In the Far East, some decrease is reported for India and Pakistan, and continued dependence on imports there is seen. Press accounts indicate an increase for China.

In Africa, the present outlook is for an increase of about 15 percent over the 1951 crop in the Northern Hemisphere countries. It is too early to have much indication of the probable production in the Union of South Africa where harvest does not begin until November. Best results for reporting countries are for Algeria where the increase is about 35 percent over last year's near-average crop and for Tunisia with a gain of 85 percent over the poor crop of a year ago.

Early season indications for South America are favorable. In Argentina, the principal wheat producer, virtually all factors affecting growth were very satisfactory at the beginning of the growing season. In addition, the acreage is estimated to be about 25 percent above last year's. The crop was a virtual failure last season.

Prospects for the wheat crop in Australia are less favorable than in 1951-52. Acreage for the country as a whole is down about 7 percent. With reductions reported for all States except Queensland, the total acreage seeded wheat for grain is the smallest since 1944-45. According to a preliminary estimate by the Australian Wheat Board the crop harvested in November-December may be about 10 million bushels below the revised figure of 161 million bushels for 1951-52.

RESERVE LEVELS FOR WHEAT

A study entitled "Reserve Levels for Storable Farm Products," recently published as Senate Document No. 130 8/ analyzes yield and other data in order to indicate the stock levels which would be necessary to offset specific yield variations for wheat, corn, and cotton. Following is a digest of those portions of the report which deal with the stock levels for wheat.

The study points out that farm products may be carried over from one crop year to another for three main purposes: (1) To provide working stocks, (2) to offset variations in production, and (3) to stabilize prices and to offset variations in demand, including provision for meeting war or defense emergencies.

Working stocks.- If inventories are reasonably well balanced as to classes and grades, experience indicates that year-end stocks of about 100 million bushels of wheat are adequate for working purposes.

Stock to meet specified yield contingencies.- Variations in crop yields from year to year are mainly due to factors beyond human control. If we do not want consumption and exports to change as much as production, or if we want greater stability in the prices, storage operations must be used to offset a part of the fluctuations in production.

Actual yield variations during the 1901-1950 period were adjusted for trends in average yields and in yield variability to make them as nearly applicable as possible to present conditions. Apart from these adjustments, it is assumed that the weather and yield fluctuations over the next several years will be similar to those of the first half of the century.

Experience of the 1901-1950 period indicates that there is about a 50 percent chance that the United States average wheat yield per seeded acre in any given year will be within 1 bushel of the trend. However, there is also about a 10 percent chance that the yield will fall below trend by 3 bushels or more. At current levels of acreage, this means a 10 percent chance that wheat production will fall below the trend by 240 million bushels or more (table 1). On the other hand, there is about a 10 percent chance in any given future year that wheat production will exceed the trend expectation by more than 200 million bushels.

The worst growing conditions actually experienced in a single year during the 1901-1950 would, at current acreage levels, drop wheat production 300 to 400 million bushels below trend. If the worst sequence of years for wheat (1933-36) were repeated, the cumulative deficiency of production below trend would exceed a billion bushels.

The study selects as reasonable the following objectives: To offset one very low yield and one moderately low yield in sequence, while maintaining minimum working stocks. A very low yield is defined as the average of the five lowest yields (adjusted deviations below trend) during 1901-1950. A 8/ Prepared in the BAE at the request of Senator Ellender, Chairman of the Senate Committee on Agriculture and Forestry.

Table 1.- Wheat: Frequency distribution of variations in yield and production 1/

Deviations from trend yield 2/	Percent frequency	Equivalent deviations in production 3/ Million bushels
Bushels per seeded acre:		
Total	100	
- 4.9 to - 4.0	4	- 399 to - 320
- 3.9 to - 3.0	6	- 319 to - 240
- 2.9 to - 2.0	8	- 239 to - 160
- 1.9 to - 1.0	8	- 159 to - 80
- 0.9 to 0	24	- 79 to 0
0 to 0.9	26	0 to 79
1.0 to 1.9	12	80 to 159
2.0 to 2.9	6	160 to 239
3.0 to 3.9	6	240 to 319

1/ 1926-34 average taken as trend for all years 1930 through 1938.

2/ Average of (1) deviations of actual yields from 9-year moving averages, centered, and (2) the corresponding percentage deviations applied to 1952 goal yields of 14.9 bushels per acre for wheat. The 1952 goal yields are considered as trend or normal levels with 1952 production techniques and average weather.

3/ Assuming 80 million seeded acres of wheat in cultivation July 1.

moderately low yield is defined as the average of the 20 next lowest yields. Using this criterion the study concludes, "It appears that working stocks could be maintained and the effects of one very low and one moderately low yield in sequence offset with carry-over stocks of about 450 to 500 million bushels of wheat a carry-over within this range would provide adequate protection against all but the worst weather contingencies in our recorded history, assuming acreages were held at about their current level."

Variations in demand.- Wide price fluctuations have also arisen from variations in demand. In the absence of price supports, low farm prices can result from a decline in demand as well as from an increase in supply. Under existing price support policies, stocks tend to build up automatically in years when yields are above average, or as demand slackens, and are available for release when demand increases or yields are unfavorable.

Year-to-year changes in domestic demand for wheat (measured by the quantities which would be utilized at unchanged prices) have been much smaller on the average than year-to-year changes in production. Although export demand for wheat has fluctuated rather sharply from year to year the major swings in demand have generally continued in the same direction for two

or more years. They could have been compensated for to a considerable extent by changes in crop acreages and even in cultural practices. Thus, no special additional commodity reserves to meet normal variations in demand are suggested in the report.

If it is desired to hold or increase export markets, the longer-run interest of wheat producers makes it advisable to meet normal export demand in full or certainly in substantial part, even in years of short domestic crops. This can be done more effectively by drawing on reserve stocks than by depending on increasing acreage, which involves not only a considerable time lag but also the 50-50 chance that below average yields will cause further delay. If the United States producers are not able to meet effective export demands, there is an incentive on the part of importing countries to increase their own production and to arrange for increased supplies from other exporters. The high prices that would be associated with inadequate United States supplies also would stimulate production in other exporting countries, especially if such a situation continued for several years.

The use of stocks to meet the initial shock of war or defense mobilization has been demonstrated twice within the last decade. However, major reliance in any long-continued war or mobilization emergency must chiefly rest on building up our basic capacity to produce in agriculture as well as in other sectors of the economy. Yields are just as likely to vary during defense or mobilization emergencies as during peacetime, while the need for protection is obviously increased.

THE RYE SITUATION AND OUTLOOK

BACKGROUND.- The August estimate of rye acreage harvested for grain for 1952 was the smallest since records were started in 1866 and production the smallest except for 1870. The 1952 acreage harvested for grain totaled 1.35 million acres, compared with 1.73 million in 1951 and the 1941-50 average of 2.29 million acres. Rye production in 1952 totaled 15.3 million bushels, compared with 21.4 million in 1951 and the 1941-50 average of 28.1 million acres (table 17).

Exports of rye averaged nearly 34 million bushels a year during the 10-years ending with 1927-28. Exports have dropped sharply since then. From 1930-34 to 1947-48, they exceeded 1 million bushels in only 4 years. In the 3 years ended with 1950-51 they averaged 5.7 million bushels.

Some Increase in Rye Acreage Probable

The national goal for rye for harvest as grain in 1953 was announced in July at 1.7 million acres. The rye acreage finally harvested has generally been substantially below the announced goals. In 1952, the 1.35 million acres estimated as actually harvested were 26 percent below the goal of 1.83 million acres. However, since the production has now reached such a low level and since prices have advanced as a result, it is probable that the acreage which will be harvested in 1953 may more nearly approximate the goal than in past years.

WHEAT PRODUCTION

DATA FOR YEAR OF HARVEST
* PER SEEDED ACRE

U. S. DEPARTMENT OF AGRICULTURE

NEG. 42549-XX BUREAU OF AGRICULTURAL ECONOMICS

Production of all wheat in 1952, estimated at 1,298 million bushels as of August 1, has been exceeded only by the 1,359 million bushels in 1947. Yields per seeded acre were very good in the 8 years ending with 1948, averaging 16.3 bushels. They were 16.7 bushels in 1952. Poor growing conditions in 1949, 1950, and 1951 reduced yields to 13.1, 14.3 and 12.7 bushels.

The national wheat production goal for the 1953 harvest calls for 72 million acres. This compares with 77.5 million acres seeded for the 1952 crop and the 1942-51 average of 70.6 million acres. Average yields on the goal acreage would result in a crop of about 1,080 million bushels. This would be enough to meet anticipated export and domestic requirements and probably add some to reserves on July 1, 1954.

RYE PRODUCTION

U. S. DEPARTMENT OF AGRICULTURE

NEG. 46025-XX BUREAU OF AGRICULTURAL ECONOMICS

The 1952 rye crop, estimated at 15.8 million bushels as of August 1, was produced on 1.4 million acres. Except for 1870 production and acreage were the smallest since records were started in 1866. Rye yields in 1952 averaged 11.7 bushels per harvested acre, compared with 12.4 bushels a year earlier, and the 1941-50 average of 12.1 bushels.

If the goal of 1.7 million acres is harvested in 1953 and average yields are obtained, 21 million bushels would be produced, which compares with 21.3 million in 1950 and 21.4 million in 1951. A crop of this size would meet domestic requirements and still hold the carry-over at about the 1952 level.

If the goal acreage of 1.7 million acres is harvested and an average yield of 12.4 bushels is obtained, 21 million bushels would be produced, which compares with 21.3 million in 1950 and 21.4 million in 1951. A crop of this size would meet domestic requirements and still hold the carry-over on July 1, 1954 at about the 1952 level. During recent years, imports and exports have approximately offset each other, and this is likely to continue.

In many of the rye-producing areas, other crops, particularly wheat, have been replacing rye. The shift-away from rye has been going on for many years as requirements have decreased. On the whole, this shift has been desirable because the other crops were more needed. However, it appears that it would be well to stabilize the production of rye, at least for the next few years, at about the level suggested for the 1953 production goals program.

Rye Disappearance in 1951-52 Second
Smallest of Record

Supplies of rye in 1951-52 totaled 27.7 million bushels, consisting of a July 1, 1951 carry-over of 5.0 million, production of 21.4 million and imports of 1.3 million. Domestic disappearance totaled 19.2 million bushels, consisting of 5.4 million for food, 4.2 million for industry, 5.5 million for feed, and 4.1 million bushels for seed. With exports of 4.6 million, the carry-over on July 1, 1952 was 3.9 million. Comparable figures covering supply and distribution, 1934 to date, are shown in table 14.

Rye disappearance of 23.8 million bushels during 1951-52 was the second smallest of record. This compares with 28.8 million in 1950-51, an average of 26.8 million in 1945-49, and an average of 45.6 million in 1940-44. About 5.4 million bushels of rye were milled for flour, 0.2 million above the previous season and 0.7 million more than in 1949-50. Consumption of rye for alcohol totaled only 4.2 million bushels last season, the smallest since 1942-43, and 3.5 million less than for 1950-51. The quantity of rye fed, which is determined as a residual item, was 5.5 million bushels, the smallest on record and compares with 5.2 million fed in 1950-51 and a 10-year average of 15.1 million.

Domestic Supplies of Rye in 1952-53
Smallest of Record

The 3.9 million bushel carry-over stocks of rye in all positions at the beginning of 1952-53 were the smallest since 1948. These compare with 5.0 million a year ago and 9.5 million two years ago. Only on July 1 of 1946, 1947 and 1948 were stocks smaller than this year.

Production of rye for 1952 was estimated at 15.8 million bushels on August 1. If realized, this would be 26 percent below the 21.4 million bushels harvested in 1951, 44 percent below the 10-year average of 28.1 million, and the smallest crop since 1870. Acreage for harvest was significantly below last year in the important producing States of North Dakota, South Dakota and Minnesota.

On the basis of the carry-over and production, domestic supplies of rye for 1952-53 are estimated at 19.7 million bushels. Supplies of this size are the smallest of record. Those for 1951-52 totaled 26.4 million bushels, compared with 28.0 million the 1945-49 average and 66.7 million the 1940-44 average. Rye imports in 1952-53 may total about the same as they did in 1950-51 when 3.0 million bushels were imported. This compares with 1.3 million imported in 1951-52 and 9.0 million in 1949-50.

With rye supplies small, domestic disappearance in 1952-53 may be only about 18 million bushels compared with the 19.2 million in the previous year, when use for alcohol and spirits was very small. This would leave 5 million bushels for carry-over and exports, though the quantity exported is likely to be small.

Rye Prices Sharply Higher Than Year Ago

With supplies small this year, prices in mid-July were 20 cents per bushel above a year earlier. At Minneapolis, No. 2 Rye averaged \$1.97 per bushel in July compared with \$1.79 a year earlier and \$1.48 two years ago (table 16). Only in 1946 and 1947 and in 1917 and 1920 was the July average higher than this year. Prices at Minneapolis for the first half of August averaged 2 cents below the average for July. Last year prices dropped from an average of \$1.79 in July to an average of \$1.64 in August. By December last year, however, they had advanced to \$2.00. Prices received by growers last season averaged \$1.54, 13 cents more than the previous season.

The 1952 rye crop will be supported at an average rate of \$1.42 per bushel. This compares with the average support rate of \$1.30 for the 1951 crop. With prices well above the loan level, farmers placed only 517 thousand bushels under the 1951 support program compared with 1.3 million bushels in 1950. With prices above support levels, very little rye will be placed under loan in 1952-53.

1/ Includes flour and products in terms of wheat.

2/ Prior to 1937 some new wheat included; beginning with 1937 only old crop wheat is shown in all stocks positions. The figure for July 1, 1937, including the new wheat, is 102.8 million bushels, which is used as year-end carry-over in the 1936-37 marketing year.

3/ Imports include full-duty wheat, wheat imported for feed, and dutiable flour in terms of wheat. They exclude wheat imported for milling in bond and export as flour, also flour free for export.

4/ Includes procurement for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement, not at time of shipment overseas.

5/ Exports as here used, in addition to commercial exports, include U.S.D.A. flour procurement rather than deliveries for export. Beginning with 1941-42, deliveries for export (actual exports, including those for civilian feeding in occupied areas) of wheat, flour, and other products, in million bushels, were as follows: 27.9; 27.8; 42.6; 144.4; 390.6; 397.4; 485.9; 504.0; 299.1; 366.1; and for 1951-52, 473.5.

6/ Partly estimated to Alaska, Hawaii, Puerto Rico, Guam, Samoa, Virgin Islands, and Wake Island.

7/ Preliminary.

1/ Exports exclude shipments by military for civilian feeding, and exports of flour from foreign wheat milled in bond.

2/ U. S. wheat and flour used with foreign wheat in milling in bond for export.

3/ USDA flour procurement rather than deliveries for export; the latter total exports including wheat and other products are given in table 6, footnote 5.

4/ Shipments, partly estimated, are to Alaska, Hawaii, Puerto Rico, Guam, Samoa, Virgin Islands and Wake Island.

5/ Includes procurement for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement and not at time of shipment overseas.

not changed

1/ Includes flour expressed in wheat equivalent. Exports of wheat products other than flour, not shown in the table, expressed in thousand bushels wheat equivalent, beginning with 1941-42, were as follows: 326; 1,265; 2,347; 2,464; 2,213; 3,441; 7,095; 1,437; 649; 575; and 535.
 2/ As reported by Department of Commerce. 3/ Classified as "unfit for human consumption" or imported for special feeding programs. 4/ Includes some flour imported free for export, which for 1939 was 214,000 bushels; 1940, 170,000 bushels; 1941, 2,000 bushels; 1942, 2,000 bushels; 1945, 19,000; 1948, 1,000 bushels, and 1949, 29,000 bushels. 5/ Includes wheat and wheat products used for livestock and poultry feed, imported duty-free by the Commodity Credit Corporation.
 6/ From the National Military Establishments; financed by U. S. 7/ Mostly from imported wheat. U. S. wheat fed in 1941-50, averaged 283,000 bushels annually. 8/ 14,072,000 reported by Department of Commerce plus 882,000 unreported exports to British Services. 9/ 142,656,000 reported by Department of Commerce plus 11,358,000 unreported January-June 1947 exports to Germany financed by the United Kingdom. 10/ 154,407,000 reported by Department of Commerce plus 11,884,000 unreported January-June 1947 exports to Germany financed by the United Kingdom. 11/ 184,324,000 reported by Department of Commerce plus 23,038,000 exports to Germany financed by the United Kingdom. 12/ 123,546,000 reported by Department of Commerce plus 9,539,000 exports to Germany financed by the United Kingdom.

1/ 1929-1940 in the *Wheat Situation*, September 1943, page 12. 2/ Subject to revision. 3/ Includes grain equivalent of flour made from U. S. wheat; and semolina and macaroni (in terms of wheat) for years beginning July, in million bushels, as follows: 1942, 1; 1943, 1; 1944, 2; 1945, 1; 1946, 3; 1947, 6; and 1948, 1; other years less than 1. Also, includes shipments to territories of the United States.

^{1/} Basis Census population adjusted for underenumeration of children under 5 and for members of the armed forces not eating out of civilian supplies. Consumption determined by adding flour imports to flour production and by deducting the following flour and products in terms of flour: Exports and shipments, military procurement, breakfast food produced in the flour milling industry. For further details on method of determination of flour consumption see The Wheat Situation, August-September 1951, pages 11-15.

^{2/} Bureau of Census. Includes estimates for 1940-44 which were developed by Bureau of Census in cooperation with BAE.

^{3/} Estimated flour equivalent of farm wheat ground for flour, or exchanged for flour, as reported by BAE.

^{4/} 100 pounds.

1/ 1934-42, farm and terminal stocks only. Beginning in 1943, the figures also include interior mill and elevator stocks.

2/ Calculated from trade sources, 1934-45; from Bureau of the Census, 1945 to date.

3/ Residual items.

4/ Includes flour.

5/ Less than 50,000 bushels.

6/ Preliminary.

1/ U. S. monthly prices are the result of weighting monthly State prices by production. U. S. marketing-year prices are the result of (1) weighting State monthly prices by monthly sales to obtain State marketing-year averages, and (2) weighting the State marketing-year averages by total sales for each State. Prices include an allowance for unredeemed loans at average loan rates.

2/ Preliminary.

3/ Computation of parity prices: Average price in base period (August 1909 to July 1914 = 72 cents per bushel) X monthly index of prices paid by farmers, interest, and taxes, as revised January and October 1950 for the period 1926 through 1949.

4/ Transitional parity for 1950, beginning January, 95 percent of parity price computed on the formula in use prior to January 1, 1950; and for 1951 and 1952, 90 percent and 85 percent, respectively, of such parity price computation.

5/ Monthly average of daily prices weighted by carlot sales. Compiled from the Minneapolis Daily Market Record.

Table 17.- Rye: Acreage, yield, and production, United States, 1930-51

Year of harvest	Acreage harvested	Yield per acre	Production
