WHEAT PRICES AND PARITY

¢ PER BU.

BY MONTHS, YEAR BEGINNING JULY; ANNUAL DATA ONLY FOR PARITY PRICE, 1910-23

* EFFECTIVE PARITY PRICE BASED ON "OLD" FORMULA

U. S. DEPARTMENT OF AGRICULTURE

NEG. 39712-XX BUREAU OF AGRICULTURAL ECONOMICS

Wheat prices have been below parity since May 1948, reflecting large crops in the United States and favorable harvests in importing countries. Wheat prices were above parity from March 1946 to May 1948, except for February 1948. Since 1920, they

were also above parity in 1924-25, 1925-26, and 1936-37. Since 1941, both the supply and demand have been very large. Wheat prices in January 1953 were 86 percent of parity, compared with 90 percent a year earlier, and 97 percent, the 1941-50 average.

Table 1.- Wheat: Average price per bushel received by farmers, parity price, and price of No. 2 Hard Winter at Kansas City, 1935-52

1/ U. S. monthly prices are the result of weighting monthly State prices by production. U. S. marketing-year prices are the result of (1) weighting State monthly prices by monthly sales to obtain State marketing-year averages, and (2) weighting the State marketing-year average by total sales for each State. Includes an allowance for unredeemed loans at average loan values.

2/ Preliminary.

3/ Computation of parity prices: Average price in base period (August 1909 to July 1914=88.4 cents) X monthly index of prices paid by farmers, interest, and taxes, as revised January and October 1950 for the period 1926 through 1949.

4/ Compiled from the Kansas City Grain Market Review. Average of daily prices weighted by carlot sales.

5/ Average for 11 months.

6/ Beginning July 1947, sales of Dark Hard and Hard Winter wheat combined, reported as Hard Winter.

Approved by the Outlook and Situation Board, February 24, 1953

SUMMARY

The large quantities of wheat placed under current support programs have reduced the supply of wheat available for sale, and as a result cash prices are expected to rise above current levels during the next few months. About 375 million bushels were under support on January 15, and farmers still had until January 31 to apply for loans, so that the total for the year may exceed the 408 million-bushel record in 1942. It is to be expected that almost all of this will be delivered to CCC. Inventories acquired from crops prior to 1952 totaled 125 million bushels on February 5, and probably will be reduced only moderately during the remainder of the marketing year. Because of the large quantity expected to be owned by CCC next July, supplies of "free" wheat in the carry-over are likely to be small.

Between 670 and 685 million bushels of wheat are expected to be used in the United States in 1952-53 compared with 678 million in 1951-52 and the average of 718 million in 1946-50 when feed use of wheat was much higher. Preliminary estimates indicate that wheat exports for the first 8 months (July-February) of the current marketing season will total about 220 million bushels. If this rate is maintained through June, exports for the 1952-53 year will total about 325 million bushels. Much will depend, however, on continued sales of wheat outside of the International Wheat Agreement, and on shipments from other exporting countries during the next few months. Canada appears now to be headed for a record or near-record year on the basis of sales and shipments to date. Exports from the above-average new crop in Argentina, on the other hand, have been slow thus far, with considerable resistance reported to high asking prices. The supply position in Australia is improved from earlier expectations.

With total disappearance of wheat in 1952-53 expected to be 995-1,010 million bushels, and the supply estimated at about 1,570 million, the carry-over next July 1 would be between 560 million and 575 million, compared with the record of 631 million on July 1, 1942, and the 1942-51 average of 335 million bushels.

Production in 1953 of fall-sown wheat was estimated in December at 611 million bushels. If spring wheat acreage is 22 million acres, about the average of the past two years, and if yields are 14.1 bushels, the same as the 1947-51 average, a spring wheat crop of about 310 million bushels would be produced. Assuming the two crops at these levels, total production would be about 920 million bushels. With domestic disappearance estimated at about 685 million bushels, 235 million would be available for export or addition to carry-over. The actual level of exports for the 1953-54 year is difficult to foresee at this time. An important factor in the situation will be the outcome of negotiations on the renewal of the International Wheat Agreement. The Council is now meeting in Washington. Also important, of course, will be the size of the 1953 harvest in importing countries and in exporting countries other than the United States.

Supplies of wheat on January 1, 1953 in the United States, Canada, Argentina, and Australia for export and carry-over totaled about 1,575 million bushels. This is about 550 million bushels more than the supplies on the same date a year earlier. Supplies are larger in each of these countries, reflecting bumper crops in 1952.

Domestic supplies of rye for the 1952-53 marketing year are the smallest of record. The 1952 harvested crop was the smallest since 1870, totaling less than 16 million bushels. Imports July 1, 1952-February 5, 1953 amounted to 1.7 million bushels, and the total for the year may be about 3.0 million bushels. Domestic disappearance for the marketing year is expected to be about 17.3 million bushels, compared with 19.1 million bushels in 1951-52. Exports to date have amounted to only about a half million bushels, and for the marketing year may total about 1.5 million bushels, compared with 4.6 million in 1951-52. Despite the small supplies of rye on hand during the current year, it is expected that all needs will be met, leaving stocks on June 30 of about 4.0 million bushels, or about the same as the 3.9 million a year earlier.

Prospects for breadgrains sown in the fall of 1952 for harvest in 1953 are less favorable than they were a year ago in most of the important producing areas for which reports are available. Unfavorable weather for field work over much of Europe, the major deficit area, curtailed fall seeding, and latest reports indicate that a smaller percentage than usual had been completed in a number of countries. Although spring seeding may be increased, total acreage may not be significantly changed from 1952, except in flooded areas. Moisture reserves in the Prairie Provinces of Canada up to November 15 were reported at 88 percent of normal, compared with 136 percent of normal a year earlier and 90 percent 2 years before.

THE DOMESTIC WHEAT SITUATION

Exports Still Estimated at about 325 Million Bushels;
Carry-over July 1, 1953 May Be 560-575 Million

Disappearance of wheat during the first half of the 1952-53 marketing year is indicated at 462 million bushels. This was 80 million bushels below the same months of 1951 and the second smallest in the past 10 years. Apparent domestic disappearance for the six months totaled 308 million bushels ^{1/}, compared with the 1947-51 average of 347 million bushels. This included food use (continental U. S. territories, and military) of about 253 million bushels, about the same as the 254 million bushels for the same period a year earlier. Exports of wheat, including products, for July-December totaled about 154 million bushels, 65 million below the high level of 219 million bushels during the same period a year earlier.

^{1/} For the 6-month period, July-December 1952, known disappearance from the July 1 supply, including imports, is about 5 million bushels larger than that indicated by January 1 stocks. This disappearance does not take into account the quantity fed. This discrepancy may be accounted for by possible inexactness in data, including some duplication in stocks reported in the various positions by different agencies. The latter duplication would be greatly reduced in the April 1 and July 1 stocks report.

Nearly 1,103 million bushels of wheat were stored in all positions on January 1 of this year. Of this about 127 million bushels were owned by the CCC, and about 350 million bushels were under the support programs. Total stocks on January 1 were 250 million bushels more than a year earlier and the second largest January 1 stocks of record. Stocks in the various positions compared with other years and other quarters are shown in table 10. Supplies available in the July-December period of 1952 were 1,565 million bushels, including imports of 18 million bushels, mostly of feeding quality grain.

Total domestic disappearance of wheat for 1952-53 is estimated at about 673-688 million bushels, including 495-500 million for food use (continental civilian, territories, and military), 90-100 million for feed, and about 88 million for seed. Preliminary estimates indicate that wheat exports for the first 8 months (July-February) of the current marketing season will total about 220 million bushels. If this rate is maintained through June, exports for the 1952-53 year will total about 325 million bushels. Much will depend, however, on continued sales of wheat outside of the International Wheat Agreement and on shipments from other exporting countries during the next few months. Canada appears now to be headed for a record or near-record year on the basis of sales and shipments to date. Exports from the above-average new crop in Argentina, on the other hand, have been slow thus far, with considerable resistance reported to high asking prices. The supply position in Australia is improved from earlier expectations.

Total supplies for the 1952-53 season are estimated at 1,572 million bushels, consisting of the carry-over July 1, 1952, of 256 million bushels, production of 1,291 million, and likely imports of about 25 million bushels. Total disappearance of 998-1,013 million bushels indicates a carry-over July 1, 1953, of about 560-575 million bushels. This is below the record level of 631 million on July 1, 1942, but is far above the 1942-51 average of 335 million bushels. On the basis of past experience, stocks of 450 million to 500 million bushels would, in addition to maintaining working stocks, provide adequate protection against the effects of one year of very low yields and one year of moderately low yields in sequence.

Support Programs Expected
To Strengthen Wheat Prices

Cash wheat markets recovered from the low levels reached on February 9 and are expected to strengthen in the next two months. The large quantities of wheat placed under current support programs have reduced the supply of wheat available for sale. On January 15, 376 million bushels had been placed under the support programs, and farmers still had until January 31 to apply for loans, so that the total for the year may exceed the 408 million-bushel record in 1942. It is to be expected that almost all of this will be delivered to CCC. (Redemptions to date have been only about 10 million bushels.) Inventories acquired from crops prior to 1952 probably will be only moderately lower than on February 5, when they totaled 125 million bushels. Because of the large quantity expected to be owned by CCC next July, supplies of "free" wheat in the carry-over are likely to be small.

Cash wheat prices on February 24 were as follows: No. 2 Hard Winter at Kansas City, \$2.36; No. 1 Dark Northern Spring at Minneapolis, \$2.39; No. 2 Soft Red at St. Louis, \$2.35; and No. 1 Soft White at Portland, \$2.44. Prices were at the loan level at Portland, but about 12 cents below at Kansas City and Minneapolis, and 17 cents below at St. Louis. On February 15, prices at Minneapolis, which did not go as low relatively as did other markets, were about 4 cents above the low of the season, but at St. Louis and Kansas City they were 21 and 22 cents above the low for these markets, which occurred in late June.

In the current marketing year, as in the 1951-52 year, no farm storage payments were made to producers, and storage charges for wheat stored in warehouses were deducted before loan funds were advanced. These storage deductions varied from about 12 cents in mid-July to 4 cents for grain deposited in late January.

1953 Wheat Crop May Be Smallest Since 1943

Production in 1953 of fall-sown wheat was estimated in December at 611 million bushels, based on seeded acreage, an appraisal of reported crop conditions on December 1, 1952, and the assumption of normal weather conditions for the remainder of the crop season. If spring wheat acreage is 22 million acres, about the average of the past two years, and if yields are about 14.1 bushels, the same as the 1947-51 average, a spring wheat crop of about 310 million bushels would be produced. Total 1953 production, on this basis, would be about 920 million bushels. Domestic disappearance is estimated at about 685 million bushels, which would leave only about 235 million bushels from 1953-54 supplies available for export or addition to carry-over. The actual level of exports for the 1953-54 year is difficult to foresee at this time. An important factor in the situation will be the outcome of negotiations on the renewal of the International Wheat Agreement. The Council is now meeting in Washington. Also important, of course, will be the size of the 1953 harvest in importing countries and in exporting countries other than the United States.

Winter wheat prospects in February continued uncertain. Mild weather in January and early February stimulated germination and growth of late-seeded wheat, and aided root development of earlier germinated wheat. However, lack of surface and subsoil moisture associated with high winds and dust storms in February was a test of survival for the small plant growth over a large portion of the southern Great Plains. There most of the wheat continues to hold on, but it depends more than usual on spring moisture to survive. Because of high winds farmers in the central and southern Great Plains areas have been working their fields to forestall damage from soil blowing, to which the young plants are extremely susceptible. During most of the winter, snow cover has been light or lacking over much of the important wheat producing area. Prospects have improved sharply in the Pacific Northwest, raising hopes that the need for reseeding may fall well below earlier probabilities. The next winter wheat report by the Crop Reporting Board will be issued on April 10. On March 19 the Board will release its prospective planting report covering the 1953 spring wheat crop.

Supplies January 1 in Exporting Countries Up Sharply;
World Trade in 1952-53 May Be Down About 8 Percent

Supplies of wheat in the United States, Canada, Argentina, and Australia for export or carry-over on January 1, 1953, totaled about 1,575 million bushels. This is about 550 million bushels more than the supplies on the same date a year earlier. Supplies are larger in each of these countries than last year (table 12) reflecting larger crops. The Argentine crop is currently estimated at 287 million bushels, compared with only 75 million last year. The 1952-53 Australian crop is now estimated at 179.8 million bushels compared with 159.7 million a year earlier. Exports of wheat, including flour in terms of grain, from these four countries during the calendar year 1952 totaled 875 million bushels, a drop of 100 million from the 1951 total, but 200 million more than in 1950. Exports from the United States dropped by 60 million, while those from Canada increased by nearly 100 million bushels. Exports from Argentina last year were very small, while those from Australia decreased sharply. Exports from Canada, Australia and Argentina, together with other supply and distribution items, for their various marketing years are shown in table 12.

World trade in wheat, including flour, in the year beginning July 1, 1952, may be down by about 8 percent from 1951-52, when it was at a record high of about 1,000 million bushels, excluding about 30 million bushels of feeding-quality Canadian wheat shipped to the United States. World trade in 1951-52 was 100 million bushels above 1950-51, 190 million above 1949-50, and approximately 25 million bushels above the previous peak in 1948-49.

The decline in trade this year results from a number of causes. Stocks in many European countries at the beginning of the marketing year were larger than in recent years, as a result of favorable production and heavy imports in 1951-52. Exports from Canada, excluding feed wheat shipped to the United States, are expected to be somewhat larger than the high level of 360 million bushels of 1945-46, and they could be substantially larger if they were not limited by that country's internal transportation system. The preliminary indication is that Canadian exports during the July-January period totaled about 235 million bushels, compared with 187 million during the same period a year earlier. Exports from the United States may be about 325 million, compared with 475 million in 1951-52. Exports from Australia and Argentina together are not likely to exceed the small exports of approximately 130 million bushels of 1951-52, while those from other areas may be around 100 million bushels, about 20 million above a year earlier. The sizable exports being made from France, French North Africa, and Turkey reflect the large 1952 crops.

Reports of Fall-sown Crops Abroad Less Favorable;
Moisture Reserves in Canada Below Normal

Prospects for breadgrains sown in the fall of 1952 for harvest in 1953 are less favorable than they were a year ago in most of the important producing areas for which reports are available. Winter wheat acreage normally accounts for about three-quarters of the total wheat acreage in the Northern Hemisphere. Unfavorable weather for field work over much of

Europe, the major deficit area, curtailed fall seeding, and latest reports indicate that a smaller percentage than usual had been completed in a number of these countries. Although spring seeding may be increased, total acreage may not be significantly changed from 1952, except in flooded areas. Early winter and unusually heavy precipitation delayed fall seeding in several countries of western Europe and caused crops to enter the winter season with less fall growth than usual.

The area sown in France up to January 1 was 8 percent less than that of a year earlier, and seeding was also backward in western Germany. In contrast, Italy's wheat acreage is at least as large as the 1952 acreage, and the crop is well advanced. Conditions are also generally good in Spain and in the United Kingdom, except in flooded areas. In the Soviet Union and the Danube Basin, seeding was delayed in some areas, but conditions appeared satisfactory at the latest report.

In turkey fall seeding was delayed by the late arrival of the fall rains in the principal wheat growing area. Current prospects appear favorable, however, and another large outturn is being forecast following the large crops of the past 2 seasons. Serious drought in the south of Syria threatens the crop in that area. Prospects are generally good for the wheat crop nearing harvest in India.

Moisture reserves in the Prairie Provinces of Canada up to November 15 were reported at 88 percent of normal, compared with 136 percent of normal a year earlier and 90 percent 2 years before. These reserves include moisture which fell on stubble land and summer-fallow between harvest and November 15, took account of rains which fell on summer-fallowed land the previous growing season and the fall before that. The percentages for the various districts were weighted on the basis of acreage. Fall rains alone (which give moisture reserves on stubble land representing two-thirds of the acres to be seeded next spring) were 84 percent of normal for Saskatchewan, 69 percent of normal for Alberta, and 77 percent of normal for Manitoba. Inasmuch as total reserves for the 3 Provinces average only 88 percent of normal, it means that conditions for growth will have to be favorable during the coming growing season for average yields per acre to be obtained.

THE RYE SITUATION

Rye Supplies Record Small; Stocks January 1 Second Smallest

Domestic supplies of rye for the 1952-53 marketing year totaled less than 20 million bushels, and were the smallest of record (table 16). They compared with 26.3 million for 1951-52, 27.0 million for the 5-year (1946-50) average, and 62.0 million for the 5-year (1941-45) average. The 1952 crop was the smallest crop since 1870. Imports of rye to February 5 totaled about 1.8 million bushels, about twice the imports during the same months of 1951-52, but was less than half the 2.3 million imported during the first six months of the 1950-51 marketing year. Imports for the year ending June 30, 1953, may total about 3 million bushels or more.

Stocks of rye in all positions on January 1, 1953, totaled 9.2 million bushels, compared with 15.7 million a year earlier. Except for 1947, they were the smallest of record (table 15).

Rye Disappearance July-December Small;
Stocks July 1, 1953 May Be About Same As Year Earlier

Disappearance of rye from July through December was 12.3 million bushels, compared with 11.5 million in the same period a year ago, when it was the smallest of record. This compares with 14.7 million for the first half of 1950-51 and 16.6 million the first half of 1949-50. About 2.6 million bushels were used for food, which is about average for the past few years. Only about .3 million bushels were used for distilling, compared with 2.3 million for the same period a year earlier and 4.0 million 2 years ago. Less than one-half million bushels of rye were exported, which was about the same as a year earlier, but only about half of that exported in the first 6 months in 1950-51. The quantity used for feed totaled about 4.2 million bushels, above the 5-year (1946-50) average of 3.8 million bushels for the same period. Seed use at 4.4 million bushels was about the same as a year earlier.

For the year ending June 30, disappearance, including exports, is expected to total about 18.8 million bushels, compared with 23.7 million bushels in 1951-52. A reduction in the use of rye for spirits and alcohol, and also for feed, largely accounts for a smaller domestic disappearance. Exports may total only about 1.5 million bushels compared with 4.6 million bushels in 1951-52. Imports of possibly 3.0 million bushels would more than offset such small exports. Stocks on June 30 may total about 4.0 million bushels, or about the same as the 3.9 million a year earlier. Imports in January were relatively heavy, so that in the period July 1-February 5 they totaled 1.8 million bushels.

Sown Rye Acreage Small

The acreage of rye sown for all purposes in the fall of 1952 was estimated by the Crop Reporting Board at 3.33 million acres. This was nearly 7 percent more than the 3.12 million acres seeded in the fall of 1951, but about one-fourth less than the 10-year average of 4.41 million acres. The condition of rye on December 1 was reported at 67 percent of normal--nearly the lowest of record. This is far below the 88 percent reported a year earlier and the 10-year average of 86 percent.

Rye Prices Below Year Ago
Despite Small Supplies

Rye prices this year have declined since November, and for the week ended February 23, No. 2 Rye $\frac{3}{4}$ at Minneapolis averaged \$1.75 per bushel, compared with the averages of \$1.98 in November and \$1.92 in February 1952. This decline reflects a smaller demand and a general lowering of all grain prices. For the entire July-January period, prices at Minneapolis averaged 7 cents per bushel above the same months a year earlier. With higher wheat prices in prospect and with the small rye supplies on hand, rye prices may strengthen again.

$\frac{3}{4}$ Weighted by reported carlot sales.

National average, prices received by farmers in the United States so far this season have been well above the Government national average price support rate of \$1.42 for the 1952 crop. In January, when rye prices were at the lowest level of the year, they averaged \$1.65 compared with \$1.71 a year earlier. However, since prices have been substantially above the loan rate, only 148,000 bushels had been placed under the support programs through January 15.

A national average price support rate for 1953-crop rye of \$1.43 per bushel for Grade 2 or better, or Grade 3 on test weight factor only, was announced on September 11, 1952. As in the past, the supports for 1953 will be implemented by CCC farm storage loans, warehouse storage loans, and purchase agreements.

1/ Average of daily cash quotations.

CORRECTION: In The Wheat Situation, issue of October-December 1952, page 21, table 5, covering rice, "Acreage Seeded", column 3, should have been 1,986 instead of 71,788. On the basis of the December revisions this has subsequently been changed to 2,003. (The 1,995 published for 1952 was correct at the time, but has since been revised to 2,021.)

1/ Per capita computations are based on population data which are adjusted for underenumeration of all age groups. The population series previously used was adjusted for underenumeration of children under 5. Consumption determined by adding flour imports to flour production and by deducting the following flour and products in terms of flour: Exports and shipments, military procurement, and breakfast food produced in the flour milling industry. For further details on method of determination of flour consumption see The Wheat Situation, August-September 1951, pages 11-15.

2/ Bureau of Census. Includes estimates for 1940-44 which were developed by Bureau of Census in cooperation with BAE.

3/ Estimated flour equivalent of farm wheat ground for flour, or exchanged for flour, as reported by BAE.

4/ 100 pounds.

1/ Exports exclude shipments by military for civilian feeding, and exports of flour from foreign wheat milled in bond.

2/ U. S. wheat and flour used with foreign wheat in milling in bond for export.

3/ USDA flour procurement rather than deliveries for export; the latter total exports including wheat and other products are given in table 7, footnote 5.

4/ Shipments, partly estimated, are to Alaska, Hawaii, Puerto Rico, Guam, Samoa, Virgin Islands and Wake Island.

5/ Includes procurement for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement and not at time of shipment overseas.

1952 7/	255,594	1,291,447											

1/ Includes flour and products in terms of wheat.

2/ Prior to 1937 some new wheat included; beginning with 1937 only old crop wheat is shown in all stocks positions. The figure for July 1, 1937, including the new wheat, is 102.8 million bushels, which is used as year-end carry-over in the 1936-37 marketing year.

3/ Imports include full-duty wheat, wheat imported for feed, and dutiable flour in terms of wheat. They exclude wheat imported for milling in bond and export as flour, also flour free for export.

4/ Includes procurement for both civilian relief feeding and for military food use; military takings for civilian feeding in occupied areas measured at time of procurement, not at time of shipment overseas.

5/ Exports as here used, in addition to commercial exports, include U.S.D.A. flour procurement rather than deliveries for export. Beginning with 1941-42, deliveries for export (actual exports, including those for civilian feeding in occupied areas) of wheat, flour, and other products, in million bushels, were as follows: 27.9; 27.8; 42.6; 144.4; 390.6; 397.4; 485.9; 504.0; 299.1; 366.1; and for 1951-52, 475.2.

6/ Partly estimated to Alaska, Hawaii, Puerto Rico, Guam, Samoa, Virgin Islands, and Wake Island.

7/ Preliminary.

8/ For the period, July-December 1952, known disappearance from the July 1 supply, including imports, is about 5 million bushels larger than that indicated by January 1 stocks. This does not take into account the quantity fed. This discrepancy may be accounted for by possible inexactness in data, including some duplication in reported stocks.

1/ Includes flour expressed in wheat equivalent. Exports of wheat products other than flour, not shown in the table, expressed in thousand bushels, wheat equivalent, beginning with 1941-42, were as follows: 326; 1,265; 2,347; 2,464; 2,213; 3,441; 7,095; 1,437; 649; 572; and 535.

2/ As reported by the Department of Commerce. 3/ Classified as "unfit for human consumption" or imported for special feeding programs. 4/ Includes some flour imported free for export, which for 1939 was 214,000 bushels; 1940, 170,000 bushels; 1941, 2,000 bushels; 1942, 2,000 bushels; 1945, 19,000 bushels; 1948, 1,000 bushels; and 1949, 29,000 bushels. 5/ Includes wheat and wheat products used for livestock and poultry feed, imported duty-free by the Commodity Credit Corporation. 6/ From the National Military Establishments; financed by the United States. 7/ Mostly from imported wheat, but an average of 283,000 bushels annually of U. S. wheat was also used in the 1941-50 period. 8/ 14,072,000 reported by the Department of Commerce plus 822,000 unreported exports to British Services. 9/ 142,637,000 reported by the Department of Commerce plus 11,358,000 unreported January-June 1947 exports to Germany financed by the United Kingdom. 10/ 154,407,000 reported by the Department of Commerce plus 11,884,000 unreported January-June 1947 exports to Germany financed by the United Kingdom. 11/ 184,324,000 reported by the Department of Commerce plus 23,038,000 exports to Germany financed by the United Kingdom. 12/ 123,546,000 reported by the Department of Commerce plus 9,539,000 exports to Germany financed by the United Kingdom.

1/ From reports of the Grain Branch, Production and Marketing Administration. 2/ Data not available by quarters for October 1, prior to 1934, or for January 1 and April 1, prior to 1935. 3/ Estimated total based upon Bureau of Census report of item "In mills and mill elevators attached to mills," for 1927 through April 1945. Data not available by quarters for October prior to 1931, or for January and April prior to 1932. 4/ Beginning July 1, 1942, wheat owned by CCC and stored in bins or other storage owned or controlled by CCC; also CCC-owned grain in transit and in Canadian elevators. Other wheat, owned by CCC as well as wheat outstanding under loan is included in other positions. 5/ Beginning with 1937 only old crop wheat shown in all positions. For the years 1927-36 inclusive, some new wheat is included in terminal and merchant mill stocks. The figure for July 1, 1937, including the new wheat, is 102,842,000 bushels.

1/ From previous crops.

2/ Six-year average; stocks prior to 1924 reported as of September 1.

3/ Preliminary. Estimated stocks for 1952, all on July 1 bases, are as follows, in million bushels:
Canada 270, Argentina 35, Australia 80.

4/ Practically no stocks.

5/ Net imports.

1/ Farm and terminal stocks, 1934-42; beginning 1943, interior mill, elevator, and warehouse stocks are included. The figure for July 1, 1943, 38.6 million bushels, excluding interior mill, elevator, and warehouse stocks, was used in computing 1942-43 disappearance.

2/ Calculated from trade sources, 1934-45; from Bureau of the Census, 1945 to date.

3/ Residual items.

4/ Includes flour.

5/ Less than 50,000 bushels.

6/ Preliminary.

1/ U. S. monthly prices are the result of weighting monthly State prices by production. U. S. marketing-year prices are the result of (1) weighting State monthly prices by monthly sales to obtain State marketing-year averages, and (2) weighting the State marketing-year averages by total sales for each State. Prices include an allowance for unredeemed loans at average loan rates.

2/ Preliminary.

3/ Computation of parity prices: Average price in base period (August 1909 to July 1914 = 72 cents per bushel) X monthly index of prices paid by farmers, interest, and taxes, as revised January and October 1950 for the period 1926 through 1949.

4/ Transitional parity for 1950, beginning January, 95 percent of parity price computed on the formula in use prior to January 1, 1950; and for 1951 and 1952, 90 percent and 85 percent, respectively, of such parity price computation.

5/ Monthly average of daily prices weighted by carlot sales. Compiled from the Minneapolis Daily Market Record.
