NATIONAL HONEY REPORT

Agricultural Marketing Service Specialty Crops Program Market News Division Unit 1, Produce Row Room 101 St. Louis. MO 63102

Phone: 314-425-4520 Fax: 314-621-3214 Website: www.ams.usda.gov/marketnews.htm

Volume XLII – Number 3 Issued Monthly March 25, 2022

HONEY MARKET FOR THE MONTH OF FEBRUARY 2022 IN VOLUMES OF 10,000 POUNDS OR GREATER UNLESS OTHERWISE STATED

Prices paid to beekeepers for extracted, unprocessed honey in major producing states by packers, handlers & other large users, cents per pound, f.o.b. or delivered nearby, containers exchanged or returned, prompt delivery & payment unless otherwise stated.

- REPORT INCLUDES BOTH NEW AND OLD CROP HONEY - (# Some in Small Lot --- +Some delayed payments or previous commitment)

DAKOTAS		
Alfalfa	White	\$2.20
Clover	White	\$2.20 - \$2.27
Clover	Light Amber	\$2.27

COLONY, HONEY PLANT AND MARKET CONDITIONS DURING FEBRUARY 2022

APPALACHIAN DISTRICT (MD, PA, VA, WV): February's weather was mostly cold interrupted periodically with a few days of above average temperatures. The warm days (over 55 degrees) resulted in an increase in colony activity as they cleaned house and performed cleansing flights. It was also an opportunity for Beekeepers to replace or provide food as needed. A few beekeepers discovered some hives had perished and those Beekeepers were actively attempting to place replacement orders for bees.

ALABAMA: Several cold snaps and lots of rain slowed down rampant colony growth that occurred during the previous month of January. Regardless, when possible, foragers were seen returning with plenty of pollen, possibly from maple and dandelion. Other plants in bloom included henbit, veronica, bittercross, alder, camellia, and callery pear, depending on the region. Some beekeepers chose to provide supplemental protein and carbohydrate sources to promote brood rearing and ensure their colonies did not starve, respectively. Nonetheless, colony growth continued, with drone cells reported throughout the state. Swarms were reported in the lower half of the state. Alabama Extension held its annual Symposium virtually this year due to the COVID-19 pandemic; 278 individuals attended from 37 states and 5 countries.

ARIZONA: More Arizona bees have returned from California's Central Valley after pollinating the state's almond crop in February. In Arizona, alfalfa conditions were rated mostly excellent to good, depending on location, with harvest taking place on more than three-quarters of the alfalfa acreage across the state.

For the entire state, pasture and range conditions were rated mostly poor to fair. In the northeastern part of the state, farmers were getting ready to start cotton planting preparations.

Some new alfalfa acres had been already planted. No exceptional dryness was reported across the state.

ARKANSAS: During the month of February temperatures were about normal across most of the state. Precipitation during February was above normal across the northern part of the state. The southern part of the state was seeing unusual below normal conditions. According to the U.S. Drought Monitor website, Arkansas had normal soil moisture across the Northern part of the state and moderate drought to severe drought conditions across the central and southern part of the state for February.

Beekeepers continue to work on cleaning and repairing existing supers, frames and pallets. They were also reporting that they were adding some supplemental feed to hives to prepare for Spring. No supply chain issues were reported. Movement is very slow this time of year. Too few prices exist to establish a current market price for wholesale white honey.

CALIFORNIA: "Weather conditions in almonds were great for the bees, and they came back looking good," a California beekeeper said. "February saw some cool weather and freezing nights, along with some decent weather and fair days," another said. "Depending on location, some bees made almond honey, a lot, while other locations are needing feed."

Although some bees made honey during their time pollinating California's almond orchards in February, the potential remains for a prolonged drought, which could limit the state's overall honey production ahead. "So, I'm not expecting much of a honey crop in California," a beekeeper said.

Beekeepers also continue to struggle with varroa mites as the pests develop resistance to the more commonly used miticides. Some beekeepers also cited thefts of hives during almond bloom as a contributing factor. Following almond pollination, some hives were moved to cherry orchards.

"Cherries are blooming a little early, and some orchards were at 50 to 60 percent bloom before the bees were placed due to the extended almond bloom," a beekeeper said. "If no rain falls in the next month, forage availability will be extremely scarce, and we will need to feed a lot to sustain our colonies." Availability of forage will help determine when beekeepers fill dead outs for their hives. "We need to fill them but may delay a bit because we do not want to supplement feed them for the rest of the year," a beekeeper said.

FLORIDA: Temperatures were about average, and precipitation was a little below normal for the month. Bee health was considered to be good. The majority of Florida bees were in California pollinating almonds. Almond bloom began around the 6th or 7th of February and did not last as long as normal. By early March, some bees were being shipped back to Florida. It appears that good almond pollination results were still obtained in a shorter period of time this year. Some bees in the state were pollinating blueberries during February. Orange bloom began early in the month and was continuing into March. Titi began blooming earlier than normal and was expected to bloom from about the middle of February until late March The bees returning from California usually miss both of these blooms. The shorter almond season this year will allow some of the returning bees to produce orange blossom and titi honey. Yellow Jasmine, which is poisonous to bees, appeared to be a little more prevalent this year. Some death losses were being reported, but it should not be much of a problem. Supplemental feeding was necessary in most areas in northern Florida at times. Most honey produced in February will not be processed until March. There was very little stored honey at the end of the month with good demand and good prices for any available supplies.

GEORGIA: Many small and some medium sized beekeepers are cutting back on rebuilding and making new hives this year due to the extra expense of wood, fuel and feed sources as their input costs are to the point of being called outrageous. Shipping costs are high and most smaller hobbyists are doubling up on deliveries while doing other business on the same trip. Weather is sporadic as one day it will be warm and then evenings will be very cold while blooms from fruit trees are full and there is plenty of feed available when the bees can get out and about. In North Georgia they still had freezing temps and are ready to play catch up with the South areas. Most of the beekeepers are still waiting to get into and check the bees in the hives and find out what shape they are in and if they have a lot of losses. The larger beekeepers are splitting hives and getting ready for new sales and purchases of Queens while rebuilding new hives for the Spring. Commercial sales are holding fairly steady, and prices may go up after the Spring pull.

IDAHO, COLORADO, UTAH: During the month of February temperatures were lower than normal across all Western and Eastern Idaho. Utah had temperatures that were above normal across the entire state. Colorado had temperatures that were below normal across the entire state. Precipitation during February was below average for Utah, Precipitation was below normal for the whole state of Idaho. Western Colorado saw precipitation that was below normal. Eastern Colorado saw precipitation that was a little more than normal for February.

According to the U.S. Drought Monitor website, in February Idaho had abnormally dry to severe drought soil with most of the state under moderate and severe drought soil conditions. Utah is currently under Severe to extreme drought conditions with most of the state under severe drought and a small patch of moderate dry soil. The whole state of Colorado is between Moderate dry to extreme drought with most of the state under Moderate to severe drought with a couple small patches of abnormally dry soil conditions.

Demand for locally sourced honey has been good throughout all three states, Producers are keeping up with the demand for local honey in all three states so far. Some producers say they are running out because of the smaller crop they got last year, others say they have excess honey and are waiting to sell it. Most producers have all their hives in California for the almond pollination. Some smaller producers have their hives in storage for the winter. Prices for the month of February were between \$2.25 and \$3.50 per pound with a mostly price of \$2.25-\$2.75 for Idaho, Colorado prices are \$2.30-\$2.40 per pound for local honey. Prices for locally sourced honey in Utah are average \$2.20-\$2.55 per pound with mostly \$2.27-\$2.36.

ILLINOIS: The weather for February has varied from a few very cold days and several seasonally warm days in the middle of the month with normal amounts of precipitation. Beekeepers have been checking on the bees to see how they are doing. Beekeepers are also going to meetings, checking and repairing equipment, ordering packages, preparing for the spring and participating in beekeeping classes. Demand for honey is good at the retail level and fairly good at wholesale level. Prices are generally unchanged.

INDIANA: The weather has been variable with many colder than average days and several warmer than average days for February with average precipitation. Beekeepers are checking on the bees. Most beekeepers report that their bees are in good condition, while others report some dead hives. Beekeepers are going to meetings, checking and repairing their equipment and preparing for the spring. Demand for honey is good at the retail level and fairly good at the wholesale level. Prices are generally unchanged.

IOWA, KANSAS, MISSOURI, NEBRASKA: No report issued.

KENTUCKY: With December and January being polar opposites in terms of weather (December being one of the warmest ever recorded, January one of the snowiest), Kentucky beekeepers have found that February began with an ice storm and included several flood-making events. Because of the ice storm, the willow bloom was delayed, and red maple bloom did not start until the last weekend of February. Other early spring blooming plants did make their appearance, i.e., crocus and daffodils, only to retreat when colder temps reappeared. The month ended with warmer temperatures, and the spring bulbs rebounded with a colorful flourish. As the Covid-virus variants continue to decline in impact on humans, beekeeping associations are beginning to meet "in-person" again. There were some hive mortalities among beekeepers who did not have adequate training in how to deal with varroa mites. However, more experienced beekeepers reported few losses in February, and overall, interest in beekeeping remained strong in Kentucky. Some bee supply companies found materials, such as lumber, difficult to obtain and transitioned to other types of wood, such as pine instead of cypress.

LOUISIANA: During the month of February temperatures were below normal across most of the state. Precipitation was well below normal. According to the U.S. Drought Monitor website, Louisiana had moderate drought conditions to a few areas of extreme drought conditions across the state for February.

Beekeepers have been busy feeding their bees. Some beekeepers feed corn syrup or sucrose, while others feed a blend in addition to pollen patties. Some bees were rather light at the end of February. The extra supplemental feeding not only helps to get good broods, but also helps fatten them up before Spring.

No supply chain issues reported. Too few prices exist to establish a current market price for wholesale white honey.

MICHIGAN: February was a cold month with very few opportunities for cleansing flights. It is still too soon to say how the survival rate will turn out for hives this winter. The snowfall in parts of Michigan has been lower than normal and is considered to be in drought conditions. This could result in lower honey production again this year.

The price for honey is still on the rise with supply chain issues and shortages of containers, woodenware, other supplies. Beekeepers are expecting shortages of bee packages due to transportation issues for moving bees around the country.

MINNESOTA: During the month of February temperatures were below normal across the entire state. Precipitation in February was a little less than average for the North end of the state and precipitation was a little above normal for the south end of the state of Minnesota.

According to the U.S. Drought Monitor website, in February northern Minnesota had abnormally dry soil to severe drought soil moisture and the southern part of Minnesota has no drought to moderate drought with mostly no dry soil.

Supply for Minnesota honey is starting to look slightly short this year for locally sourced honey, but producers seem to be keeping up with the demand.

Prices per pound in Minnesota were \$2.25-\$5.00 with mostly price of \$2.27-\$3.00 for locally sourced honey for the month of February.

MISSISSIPPI: Beekeepers are just now checking on the bees and splitting hives to make room for the new Queens coming in. Lots of rain and cold temps kept the bees inside as the pollen washed away. Some extra feeding is used to keep the bees in proper weight and condition. Beekeepers are hoping for the weather to become more Springlike so that the bees can get out and about and forage all the new blooms and feed available.

MONTANA: No report issued.

NEW ENGLAND: No report issued.

NEW YORK: A few warmer days in February allowing for bee cleansing flights. Beekeepers checking hives and feeding with sugar, with many hives consuming supplemental feed quickly. Many areas still have significant snowpack preventing access to hives. Some beekeepers have realized the winter hive loss in February and are making late bee replacement orders; other beekeepers are awaiting early orders of bees arriving in March. This is the time to prepare hives for the spring: equipment assembly, scraping/cleaning, adding new wax foundation to old frames. Honey sales and prices are steady. Many clubs are resuming in-person activities, particularly with relaxation of masking mandates.

NORTH CAROLINA: Temperatures in North Carolina were slightly above normal in February with a statewide average temperature of 45.7°F; precipitation was below normal. Overall statewide soil moisture levels were rated 0 percent very short, 12 percent short, 85 percent adequate, and 3 percent surplus the week ending February 19. The North Carolina Drought Management Advisory Council reported 45 counties as being abnormally dry and 9 counties as experiencing moderate drought conditions.

Colony conditions varied by management practices. According to apiary inspectors, reports of varroa mites, hive beetles, and starvation were noted from the mountains to the coast. As was feared last month, robust brood rearing after December's above normal temperatures led to higher consumption of stores in January and February. Limited Red Maple and Sugar Maple were in bloom in the Piedmont and Coastal Plain regions. Bees could also be seen working ornamental evergreen shrubs such as Camellias. Colonies now left with only what they can forage for are at higher risk of starvation, especially if unseasonable weather confines them to the hive for four or five consecutive days in March. Well managed hives, however, were in generally good health and apiary inspectors expect to see swarms by the second or third week of March.

Commercial pollinators were in California for fruit and tree nut pollination. Those that remained in North Carolina spent the month building up their beehive populations for local pollination starting in March or April. Replacement bee operations continued to prepare for a season of high demand that is expected to exceed supply.

Retail honey prices at the Raleigh State Farmers' Market were generally unchanged: \$7.00-\$8.00 per 8-ounce jar, \$12.00-\$13.00 per 16-ounce jar, \$20.00-\$22.00 per 32-ounce jar, and \$18.00 per 44-ounce jar; processed honey, creamed, was \$10.00 per 16-ounce jar. Prices at the Piedmont Triad Farmers' Market in Greensboro were also unchanged at: \$8.00-\$12.00 per 8-ounce jar, \$12.00-\$18.00 per 22-ounce jar, and \$20.00 per 32-ounce jar.

NORTH & SOUTH DAKOTA: Winter precipitation at home helps with topsoil moisture. Most bees in California were in position to work the projected early bloom for the California almond crop. Cold temperatures delayed and damaged bloom in many areas. Prior to the freeze the bloom estimates looked good, by the end of the month it was still too early to determine the effects of the weather on the success of the pollination and size of the crop.

OHIO: February was a tough month for bees and beekeepers. Temperatures fluctuated up and down with cool rain one day then freezing temperatures and snow the next. Overall, it was a gray wet, dismal month. Southwest Ohio received the most precipitation with 4.39 inches in Montgomery County and 4.07 inches in Clinton County.

Northwest Ohio: We had the normal February roller coaster of temperatures which allowed a couple of days each week for the last 3 weeks for the bees to have cleansing flights. We are hearing that the winter losses will be in the 30%-40% range. Honey prices are \$5.50 to \$6.50 per pound wholesale and \$8.50 to \$10.50 per pound retail.

Southeast Ohio: The winter is about two thirds over, at least we hope so. The weather has been crazy with very cold spells followed by fifty and sixty degree-days. We have also had lots of snow and rain with flooding conditions in many areas. There are a few scattered reports of 100% colony loss but most reporting 50 to 70 % losses. This time of the season the bees always need pollen, so, continuation of feeding both fondant and pollen substitute patties. Surviving colonies appear to be strong and building up slowly. Any weak colonies will defiantly require close supervision and feeding.

West Central Ohio: February has had very low temperature dips then warm temperatures near 60 degrees which allowed the bees to fly to void feces and feed on dry protein flour. We had two ice storms, and above average rain fall. Beekeepers with commercial genetics bees are having losses up to 70%. Beekeepers with locally adapted genetics are having 25% losses. The colonies are producing new bees which require protein and carbs to feed the larvae, a critical period of time for bee colonies in cold weather.

Most of Ohio received a great deal of snow, with two cities in Cuyahoga County getting 16 and 10.5 inches of snow February 3, and Lorain County (also by the Lake) being piled with 12" of snow. Even Gallipolis in the Southern most point received a little bit of snow. Temperatures ranged from 6 to 61 degrees in Akron, 10 to 61 degrees in Findlay (west of Lake Erie), and 12 to 64 degrees in the Cincinnati area.

February and March are often the deadliest months for honeybees as they become active on warmer days and can consume stores close to the brood, then have nothing to eat during the colder days when the cluster is compressed. Another problem is that worker bees can become stranded away from the cluster and not make it back before temperatures drop again. Beekeepers need to monitor closely and continue feeding sugar and/or winter patties if the bees are near the top.

OKLAHOMA: During the month of February temperatures were well below normal across most of the state. Precipitation was well below normal across the state. According to the U.S. Drought Monitor website, severe to extreme drought conditions covered the state with an area of exceptional drought in the panhandle in February. Too few prices exist to establish a current market price for wholesale white honey

OREGON: No report issued.

SOUTH CAROLINA: No report issued.

TENNESSEE: Beekeepers are reporting heavy winter losses across the state. Red Maple, Henbit, Forsythia, Dandelion, Speedwell, and other small wildflowers are the current sources of nectar and pollen. Beekeepers are still reporting supply chain issues with bee supplies and containers for honey packing.

TEXAS: During the month of February temperatures were well below normal across most of the state. Precipitation during February was normal. According to the U.S. Drought Monitor website, soil moisture conditions for February were typical. Normal soil moisture along the gulf coast to moderate in Central Texas to extreme drought across the West sums up Texas pretty well.

According to beekeepers most bees were looking good, but still on the light side. In the attempts to increase weight on bees beekeepers were busy adding supplement corn syrup and pollen to stimulate colony growth. Texas beekeepers are hoping for an early and wet spring to get the wildflowers started.

No supply chain issues reported yet. Beekeepers that are planning on moving their hives are keeping a close watch on the current situation with truck availability. Too few prices exist to establish a current market price for wholesale white honey.

WASHINGTON: February was mixed with some snow, some heavy rains, as well as warm and dry spells. While year to date precipitation are generally average for most areas in Central and Eastern Washington, the snow-water equivalents are generally low for all areas East of the Cascades. More snow, especially in the mountains is needed to fill all irrigation needs later this year. The rain at lower elevations has removed all of the lower elevation snows which will likely limit Spring runoff and put more pressure on irrigation sources.

WISCONSIN: The weather for February has been sunnier than this time last year and the average temperature has been colder with light amounts of snow which is less than usual. Beekeepers have been checking on the bees to see how they are doing. A high percentage of checked hives perished with surviving hives being fed stored honey and sugar cake. Demand for honey is good at the retail level and fairly good at wholesale level. Prices are generally unchanged.
