SUGARCANE -- Sugar, Seed, Sirup

Acreage, Yield, Production, Disposition, Price, and Value
By States, 1909-59

This publication presents historical statistics on acreage, production, disposition, price and value of sugarcane grown for sugar, seed, and sirup. These estimates of the Crop Reporting Board are based on reports from cane growers and processors, and on data furnished by the Sugar Branch, ASCS (formerly AAA, PMA, and CSS) of the Department of Agriculture and by the Bureau of the Census.

Sugarcane for Sugar and Seed: Production of sugarcane for sugar is an industry of longstanding in Louisiana and estimates are available for all years covered by this report. Estimates for Florida begin with 1923, the year when production reached significant quantities. Production of cane for sugar in Texas was discontinued about 1923. U. S. statistics in this publication are for cane grown on the Mainland.

Sugarcane for seed is that portion of the current year's crop of cane which is used to plant acreage from which cane will be harvested in the succeeding year or years.

The price per ton is the season average price received by growers for cane for sugar at their farms, and includes average support payments for years in which such payments were made. The prices do not include payments made under the Jones-Costigan or Sugar Acts, nor do they include the cost of hauling cane to the factory or other handling or administrative costs. Cane produced on farms operated by sugar factories is valued at the price paid to independent growers, not at the "cost of administration cane", which frequently is used by factories in segregating grown and processing charges.

The values of production are determined by multiplying the season average price per ton by the tons of cane used for sugar and by the tons of cane used for seed. The values shown are for the marketing season, or crop year, and should not be confused with cash receipts, which relate to the calendar year. The crop marketing season is October 1 to January 31 for Louisiana, and November 1 to April 30 for Florida.

Production of sugar and molasses is included even though they are not strictly farm products. The estimates represent, for most years, complete output reported by factories. Since 1934 these data have been made available through the operation of the adjustment and control programs of the Department of Agriculture. Sugar production is shown in terms of both "raw value" and "refined basis." The Sugar Act of 1948 defines the raw value of a quantity of sugar as its equivalent in terms of ordinary commercial raw sugar testing 96 sugar degrees on the polariscope. A ton of sugar, raw value, equals 0.9346 tons of sugar, refined basis. For the years prior to 1934, blackstrap molasses is on an "as reported" basis; since that time it is on an "80 degree Brix" basis.

Although Hawaii was not one of the States of the Union during the period covered by this publication, acreage and production of sugarcane for sugar, and production of sugar and molasses, for the calendar year, are shown. These statistics, which are not included in the United States estimates, are given in order to furnish historical data for the fiftieth State.

Sugarcane for Sirup: Statistics on sugarcane sirup for the major producing States for the years 1909-59 are given in this publication. Production has been of sufficient volume to warrant preparation of estimates during the entire period for only four States -- Georgia, Alabama, Mississippi, and Louisiana. A sharp downward trend in the acreage of sugarcane grown for sirup has led to the discontinuance of estimates in the other States.

Estimates of farm disposition, as the term implies, relate to disposition of the crop year production on the farm where the sirup was produced. Sirup used in the farm household is the sirup consumed on the farms growing sugarcane for sirup. Sirup sold, including toll, is the quantity of sirup actually sold by the grower plus the quantity given as toll to the operator of the sirup mill in payment for grinding the cane and making the sirup. Giving a portion of the sirup to pay for processing is equivalent to selling the sirup and making a cash payment to the sirup mill operator. For all States except Louisiana, the December 1 price received by farmers is used to evaluate production and sales. For Louisiana, the season average price is used, including the price received by sirup mills for bulk sirup. The price received by farmers relates largely to sirup in cans (usually one gallon).
