Agricultural Prices

1993 Summary

Agricultural Prices

1993 Summary

The 35th Annual Summary of Agricultural Prices contains prices farmers received for commodities sold as well as prices paid for production input goods and services. Prices are weighted and aggregated into price indexes. These indexes provide measures of relative price changes for agricultural outputs and inputs.

The State, Regional, and U.S. average prices for agricultural commodities and farm production inputs are based on voluntary reports from agri-business firms, merchants, dealers, and farmers throughout the Nation. These data are collected at regular intervals using mailed inquiries, telephone, and personal enumeration. We greatly appreciate the cooperation and support of all the individuals and firms that have provided data.

Estimates of prices received by farmers are published by state for crops (1992-93), vegetables (1991-93), and livestock and poultry (1992-93). U.S. prices received and prices paid are published for 1988 through 1993. Estimates for prices paid by farmers for feed, fuel, and fertilizer are published by region for 1993. Prices paid for all other surveyed items are published for 1993 at the U.S. level. U.S. price indexes for both prices received and paid including any index revisions are published for 1983-93.

Preliminary crop prices for 1993 and fruit and vegetable prices for 1992 are subject to revision. Prices received for livestock and poultry are final estimates. Prices received and prices paid revisions are first published in the monthly issues of "Agricultural Prices" and again in the Annual Summary.

1993 Agricultural Prices Annual Summary

Agricultural Commodity Prices represent monthly and marketing year averages received by farmers at the point of first sale for all grades and qualities of the commodity sold. Points of first sale by farmers range from bulk sales at the farm to packed and graded products delivered to a local market. For crops the price refers to all sales, regardless of the year harvested. The average price concept is that price which would result from dividing the total dollars received by all farmers, before any marketing charges are deducted, by the total quantity sold. Contract sales are reported in the month of settlement, not when the contract is made. Prices are on an "as sold" basis, with the following exceptions: milk is priced f.o.b. plant or receiving station; fruit and vegetable pricing is covered in detail on page A-2.

Monthly Prices are based on all sales of the commodity during the entire month. Exceptions are hay, eggs, and turkeys which are based on the 5-day period centered on the 15th of the month. State commodity prices are estimated for months when at least 0.5 percent of the annual sales occur. Weights for computing monthly United States average prices are based on estimated marketings during the month by State.

Marketing Year Average (MYA) Prices are weighted average prices for crops, livestock, and poultry items sold during the marketing year. Commodity marketing years are defined on pages A-17 and A-18. State marketing year average prices are computed by weighting monthly prices by the estimated percentage of monthly sales during the marketing year. State and U.S. monthly and marketing year average prices for crops are open-market prices excluding Government program payments or allowances for unredeemed loans and purchases by the Government. Government payments to farmers are included in farm income accounts as a separate cash receipt item. U.S. marketing year average prices for corn, sorghum, oats, barley, wheat, rice, soybeans, flaxseed, sunflower, and upland cotton are computed by weighting U.S. monthly prices by monthly marketings for the U.S. marketing year. Other crops, livestock, and poultry U.S. marketing year average prices are computed by weighting State marketing year average prices by the estimated quantity sold in each State.

Calendar Year Average Prices are unweighted January through December monthly average prices. For instance, calendar year average prices for milk cows at the State level are the simple averages of the four quarters. The U.S. calendar year average price for milk cows is computed by weighting the State calendar year average prices by the January 1 inventory of milk cows on farms.

Preliminary Marketing Year Average Price estimates for 1993 are based on price data through February 1994 for all field crops except: small grains - based on data through May 1994; potatoes and sweetpotatoes - based on reported data through December 1993; cotton - based on data through March 1994; and tobacco - based on data through April 1994. Marketing years for fruit, vegetables, and nuts vary by State and commodity. Allowances are made for the portion of the crop expected to be marketed during the remainder of the marketing year for all commodities except cotton.

Monthly and Marketing Year Average Crop Prices for 1992 are final except for fruit. Crop prices for 1993 are subject to revision. These revisions will be published first in the monthly issues of Agricultural Prices and then in the "Annual Summary". Livestock, livestock products and poultry prices are final estimates for 1992 and 1993. Prices for agricultural commodities may be revised during the Agency's five-year review of production estimates. Price revisions resulting from this review are usually small and generally are the result of reweighting State prices to the U.S. level.

State monthly and MYA prices for noncitrus fruit sold for fresh market are the weighted average of prices received by producers at the points of first sale. Points of first sale include f.o.b. shipping point, farm, roadside, U-pick, farmers' market, grower auctions, and bulk sales to a packer. The exceptions to this are California, Washington, New York (apples only), and Oregon (excluding peaches), which use equivalent returns at the packinghouse-door. This is a *f.o.b. packed shipping point price adjusted back to the packinghouse-door* by subtracting all costs that accumulate between the packinghouse-door and the f.o.b. shipping point. Costs include cleaning, grading, packing, inspecting, and marketing. U.S. monthly prices are the weighted averages of the state prices. U.S. MYA Prices are derived by dividing the sum of states' values of production by their sum of production. Monthly prices include all fruit sold in a month regardless of the crop year in which it was harvested.

State MYA prices for noncitrus fruit sold for processing are the equivalent returns producers receive for fruit delivered to the processing plant door. The exceptions are California olives and clingstone peaches which are priced at the first delivery point, and cranberries which is a weighted average of adjusted co-op pool proceeds and independent sales at the first delivery point. U.S. MYA prices for noncitrus processing fruits are derived by dividing the sum of states' values by their sum of production. There are no monthly price series for noncitrus processing fruits.

State and U.S. MYA prices for noncitrus crops at the "all sales" level (fresh and processing) are derived by dividing total value by total production.

State monthly citrus prices are based on weighted average f.o.b. packed prices received for fresh fruit, and weighted average prices received at the processing plant door for processing fruit. Equivalent returns for fresh and processed fruit are calculated at the packinghouse-door and on-tree levels by deducting picking, hauling, sorting, grading, packing, cooling, marketing, and other costs from the two base prices.

State MYA prices and equivalent returns for citrus are calculated from the weighted average fresh and processed prices received each month in the crop's marketing season. The crop year 1992-93 as shown on all citrus tables in this publication refers to the crop which bloomed in 1992 and was marketed during the 1992-93 season. (See page A-18 for a description of the citrus marketing seasons.)

Monthly and MYA citrus prices at the U.S. level are the average of the states' prices weighted by their box movement and approximate net weight per box. The box weights used are as follows: Grapefruit: Arizona and California Desert Valleys - 64 lbs., other California areas - 67 lbs., Florida - 85 lbs. and Texas - 80 lbs; Lemons - 76 lbs; Limes - 88 lbs.; Oranges: Arizona and California - 75 lbs., Florida - 90 lbs., and Texas - 85 lbs., Tangelos - 90 lbs.; Tangerines: Arizona and California - 75 lbs. and Florida - 95 lbs.; Temples - 90 lbs.

State monthly fresh market vegetable prices are f.o.b. shipping point, f.o.b. equivalents, or point of first sale prices. The state MYA prices for fresh market vegetables are the weighted average of the monthly prices using estimated monthly movements. U.S. monthly prices are the weighted average of state prices. U.S. MYA prices are derived by dividing the sum of states' values of production by their sum of production. (Prices for broccoli, carrots, cauliflower, celery, and onions may include some processing.)

Preface

Agricultural Inputs: The Index of Prices Paid by Farmers measures changes in the prices paid for goods and services used in crop and livestock production and family living. The index is made up of 5 major components. In terms of total farm expenditures, the production component accounts for nearly 60 percent of the total and the family living component represented by the Bureau of Labor Statistics' Consumer Price Index (CPI-U) accounts for about 30 percent of the index. The remaining three components are: (1) interest charges per acre on mortgage indebtedness secured by farm real estate; (2) taxes payable per acre on farm real estate; and (3) wage rates paid to hired farm labor. Prices Paid Indexes are not seasonally adjusted and there are no adjustments for quality changes.

The two components of a price index are price and quantity. Both prices received and prices paid indexes are fixed weight indexes. Weights for the prices paid indexes are based on average farm expenditures during 1971-73. Indexes are published on a 1977=100 base and a 1910-14=100 base. The Office of Federal Statistical Policy and Standards Directive No. 5 directed that the 1977 base year be in use by January 1982 for Federal Government general purpose index numbers. The 1910-14=100 base is required under the Agricultural Adjustment Act of 1938, as amended. The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes, and Farm Wage Rates on the 1910-14=100 base is called the Parity Index. The Parity Index reflects relative price change but does not take into account the technological advancements and increased productivity of American agriculture.

The number of input items consumed on farms is so extensive that it is not feasible to collect price data for all of the inputs. Therefore, about 180 selected items are priced to represent groups of similar items purchased which make up the major production expenditures categories.

Items on the questionnaire are described in the simplest way consistent with definite identification. Firms are requested to report the prices for the item most commonly sold which meets the general specification on the questionnaire. Reported data are summarized to regional estimates and then weighted to U.S. prices. Weights are based on available consumption or expenditure information. Average prices including state and local taxes are used in computing the indexes and are published in Agricultural Prices in the same month as the survey. Regional prices are published for feed, fuel, and fertilizer. Only U.S. prices are published for the remaining items surveyed.

Revisions: Production input prices published in this Annual Summary are considered final and usually are not subject to revision since additional information is not available for most items. Components of the production index are generally not revised since prices are seldom updated. The index is recomputed quarterly to reflect the latest wage rates. However, the overall Index of Prices Paid Including Taxes, Interest, and Wages is subject to change as annual revisions are usually made in the taxes, interest, and cash rent and farm services components of the index.

Parity Ratio: The Parity Ratio is the ratio of the Prices Received Index, 1910-14=100, to the index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes, and Wage Rates on a 1910-14=100 base. The Parity Ratio is a measure of price relationships; not a measure of farm income, of farmer's total purchasing power, or of farmer's welfare. The well-being of the farm community depends upon a number of factors other than price relationships such as changes in production efficiency and technology, quantities of farm products sold, and supplementary income, including income from off-farm jobs, and federal farm programs.

Ratio: The ratio of the Prices Received Index to the Prices Paid Index on the 1977 base provides an indication of the change that has occurred in the prices farmers receive for their commodities relative to the change in the cost of inputs using 1977 as the reference year. When this ratio is greater than 100 percent, it implies that farm commodity prices have increased at a faster rate than farm input prices. When the ratio is less than 100 percent, farm input prices are increasing at a more rapid pace than farm commodity prices.

Relative Importance

The relative importance of the component indexes that make up the Index of Prices Paid by Farmers, including Interest, Taxes, and Farm Wage Rates were annually calculated in June prior to 1986. The prices paid program changed to a quarterly basis, effective March 1986, with the relative importance of component indexes now calculated annually in April. Relative importance is the percent of total contribution that a component makes to the overall Prices Paid Index at a given point in time. The change in relative importance from year-to-year is determined by the rates of price change for various items in relation to each other. It reflects the impact of the index items at current price levels on the overall index. This may be more or less than the previous year or base weight period as a result of larger or smaller price changes for an item or index compared with other items or indexes.

Quantity weights used for index computation are based on the 1971-73 period. Relative importance in the 1971-73 base period for individual commodities was published in "Index Numbers of Prices Received and Prices Paid by Farmers", Pr 1-5 (76), May 1976, pages 47-51.

1/ Data shown indicate the contribution of each component to the prices paid index. The Relative Importance is obtained by multiplying each index value for April 1993 times the base year, 1971-73 percentage weights for each component index and adjusting to equal 100 percent.

2/ Same as index weights.

3/ Beginning in January 1977 the Bureau of Labor Statistics (BLS) Consumer Price Index (CPI) was used in place of the USDA-NASS family living index.
