## Vegetables

United States Department of Agriculture

Washington, D.C. 20250

RELEASED: July 17, 1987 3:00 P.M. ET

### PROSPECTIVE AREA FOR FRESH MARKET VEGETABLE HARVEST UP 3 PERCENT FROM 1986

Prospective acreage of 7 fresh market vegetables for harvest during the summer season in the major producing States is estimated at 276 thousand acres (112 thousand hectares), 3 percent more than a year ago. Broccoli and cauliflower acreage decreased while other crop acreages increased. The vegetables included are broccoli, carrots, cauliflower, celery, sweet corn, lettuce, and tomatoes.

Honeydew melon acreage for harvest totals 19.6 thousand acres (7930 hectares), a 13 percent increase over the same period a year ago.

U.S. Onion acreage is set at 121 thousand acres (49.1 thousand hectares), up 5 percent from last year but 1 percent below 1985. Summer non-storage production is forecast at 3.47 million cwt (158 thousand metric tons), down 8 percent from last year.

Planted area for the 5 major processing vegetable crops is estimated at 1.31 million acres (531 thousand hectares) contracted, up 4 percent from last year but 6 percent below 1985.

For Information Call: (202) 447-3843

<sup>1/</sup> INCLUDES FRESH MARKET AND PROCESSING.

BROCCOLI: The prospective area for harvest in California during July-September is 19.4 thousand acres (7.85 thousand hectares), down 1 percent from the same period last year. Weather has been very favorable and harvest is proceeding on schedule. Heavy supplies are available from the Salinas and Santa Maria areas.

CARROTS: The area for harvest during the summer season is estimated at 26.6 thousand acres (10.8 thousand hectares), a 22 percent increase from the summer of 1986.

Michigan's crop is developing about a week ahead of normal. Outlook is good with no widespread disease or insect problems.

Harvest of California's summer crop is proceeding in the San Joaquin and Salinas Valleys. Maturity and quality are about normal. Some seeders were reported.

CAULIFLOWER: The prospective area for harvest in New York and California during the summer season is estimated at 13.5 thousand acres (5.46 thousand hectares), which is 6 percent less than a year ago.

California weather has been favorable for growth and development. Harvest has been moderate on the central coast with mostly good quality.

CELERY: During the summer, 7800 acres (3200 hectares) are estimated for harvest. This is 17 percent more than a year ago.

Michigan celery got off to a good start with growth and development slightly ahead of normal. The outlook for Michigan celery is good.

Transplanting and direct seeding of California celery continued active in the central coast district. Growing conditions have been near normal.

SWEET CORN: Summer sweet corn acreage for harvest, in the major producing States, is estimated at 111 thousand acres (45.1 thousand hectares), a 2 percent increase from a year ago.

North Carolina's harvest became active about June 25 with the average starting date being July 7. Weather was excessively wet in April and turned dry during May hurting the crop to some extent. Supplies are ample at present time but market conditions are weak.

Pennsylvania's crop is developing ahead of normal. The crop is generally in good to excellent condition but needs rain in some areas.

Sweet corn planting is completed in New Jersey. Soil moisture is generally adequate. Severe thunderstorms in June caused some crop losses in the central part of the State. Above normal temperatures accompanied by high humidity were not beneficial to crop quality. Current harvest of sweet corn is mostly being sold at local roadside stands. Good volume for the open market will be available about July 10th.

Mild spring temperatures and dry soils allowed many producers to plant sweet corn in Ohio earlier than usual. Some sweet corn was planted as far north as Toledo on the twenty-ninth of March. This resulted in sweet corn harvest in that area about one week later than in the Southeastern area along the Ohio River where harvest began about June 24. With Ohio's growing degree days running 25% ahead of the long term average, volume sweet corn harvest began the first week in July. Corn ear worm has been difficult to control and harvest has been disrupted by wet soils and frequent thunder showers in early July.

Growth and development of Michigan sweet corn is slightly ahead of normal. Dry weather has stressed the crop but recent rains will help.

California's fields got off to a good start and appeared not to have been affected by the hot weather. Early harvest started in the Westside area with the big push around the first of July. By early July, harvest in the Sacramento Valley was also underway.

HONEYDEW MELONS: Acreage for harvest is estimated at 19.6 thousand acres (7.95 thousand hectares), 13 percent more than a year ago.

Harvest of honeydew melons began the second week of June in the west and later in the month in central Arizona. Market conditions have been poor as of late, resulting in many producers prolonging harvest; crop quality has been reduced because some fruit has been left in the field too long.

Harvest is steady in southern California and will begin soon in the San Joaquin Valley. Weather has been normal and quality generally good.

TOMATOES: Prospective summer area for harvest is estimated at 49.5 thousand acres (20.0 thousand hectares), up 2 percent from a year ago.

Development is ahead of normal in Pennsylvania. There have been a few minor problems with insects. The crop is in good to excellent condition but some irrigation is required.

In New Jersey, tomato planting was completed on schedule. Hot, humid weather has increased crop growth but might adversely affect the fruit quality. Harvest began the last week of June and good volume is expected to reach markets in mid-July.

Harvest of the Alabama tomato crop is underway with peak movement expected by the middle of July. Dry weather during late May and early June slowed growth and development, but recent rains have put the crop in mostly good condition.

Michigan's tomato crop is developing ahead of normal. Stands and outlook are good.

Growing conditions in California have been good. There were reports of plants hurt by heat, which has affected set. Harvest has started in a few areas and is gaining momentum.

LETTUCE: Summer acreage for harvest is estimated at 47.7 thousand acres (19.3 thousand hectares), 1 percent above the 1986 summer season.

Colorado crop progress is running a week or so ahead of schedule. A lack of hard winds, normally experienced in the San Luis Valley, and early rains will increase harvested acres. Harvest began after the 4th of July. Irrigation water is adequate.

California harvest is now heavy in Central coast districts. There are wide ranges in size and appearance but over-all quality is good.

<sup>1/</sup> PRIMARILY FRESH MARKET. 2/ PRIMARILY FOR PROCESSING.

#### ONION ACREAGE UP 5 PERCENT

Onion acreage harvested and to be harvested in 1987 is estimated at 121 thousand acres (49.1 thousand hectares), up 5 percent from last year but 1 percent below 1985. The spring crop covers 18 percent of the acreage; summer non-storage 10 percent and summer storage the remaining 72 percent.

Production of NON-STORAGE SUMMER ONIONS is forecast at 3.47 million cwt (158 thousand metric tons), down 8 percent from last year but 24 percent above the 1985 crop. Harvest area is set at 11.7 thousand acres (4730 hectares), up 4 percent from last year. The average yield is forecast at 297 cwt per acre, down 11 percent from 1986 but 5 percent above 1985 yields.

Harvest activity is steady in New Mexico's southern area and is beginning in the High Plains. In Texas' High Plains, harvest began in early July about two weeks behind schedule. A late spring freeze and cool, wet weather limited progress. Hail damage in the Trans-Pecos area slowed development and sizing. In Washington, harvest is about 10 days ahead of normal, with average sizes and good volume.

SUMMER STORAGE ONIONS acreage for harvest (except California) is estimated at 61.2 thousand acres (24.8 thousand hectares), up 9 percent from last year but 1 percent below 1985. California acreage of 26.6 thousand acres is down 1 percent from last year with onions used mostly for processing. Total U.S. summer onions acreage at 99.5 thousand acres (40.3 thousand hectares) gained 6 percent over last year and 3 percent over 1985.

Washington onions are ten days to two weeks ahead of normal. In Oregon's Willamette Valley where about two-thirds of other Oregon acreage is located, soil moisture is below normal and stands are thin. In Eastern Oregon, the crop is irrigated and in good to excellent condition. Idaho onions are ahead of last year and have had good growing weather. In Colorado, onion plantings are showing a slight increase from the March intentions survey.

Minnesota weather has been hot and dry so far this season. Seeding was very early in good subsoil moisture conditions, so stands got a fairly good start. Michigan's onion crop is developing slightly ahead of normal with good condition. Early New York fields are being harvested. The growing season is two-weeks ahead of normal.

California growing conditions have been normal for summer onion production. Good quality and size are indicated in most areas.

#### PROCESSING VEGETABLE ACREAGE UP 4 PERCENT

Planted area of the five major processing vegetable crops is up 4 percent from last year, but 6 percent below 1985. Processors reported a total of 1.31 million acres (531 thousand hectares) contracted to sweet corn, snap beans, cucumbers for pickles, green peas, and tomatoes. Cucumber acreage is down 3 percent from last year, but the other four crops are at or above. Snap bean acreage is up 10 percent; corn and peas are up 5 and 4 percent each; while tomatoes are contracted on about the same acreage.

CUCUMBERS FOR PICKLES are contracted on 90.9 thousand acres (36.8 thousand hectares), down 3 percent from last year. Early and mid-season pickles cover 82.6 thousand acres; while late acreage is set at 8290 acres. Planted acreage is 8 percent above March intentions this year. Harvest is underway in some of the early States.

Production of GREEN PEAS FOR PROCESSING is forecast at 415 thousand tons (376 thousand metric tons), fractionally more than last year but 28 percent below 1985 production. Acreage for harvest, at 280 thousand acres (113 thousand hectares), is up 3 percent from last year, but 21 percent below 1985. The average yield is projected at 1.48 tons per acre, down from last year 1.52 tons per acre and well below the 1.63 tons per acre produced two years ago.

Harvest is in progress in major areas, mostly ahead of schedule. High temperatures and drying fields have lowered yields and pushed development. Wisconsin processors reported nearing drought conditions. Yields were below budget in Minnesota. The New York crops looks good in spite of warm, dry weather. In the Western States, crop progress is ahead of normal and expected to finish in mid-July.
