## FARM EMPLOYMENT UP MORE THAN USUAL

th generally favorable weather in most parts of the country during May, considerle progress was made in catching up with seasonal farm work which had been retardby a late spring. The U. S. Department of Agriculture reported today that total
rm employment is estimated at 11,285,000 for the first of June, an increase of 12
rcent from May 1 compared with a normal rise of 8 percent from May 1 to June 1.
tal employment on June 1, however, was 3 percent below a year earlier, due mainly
a 9.5 percent decrease in the number of hired workers, as the number of family
thers was only one percent below June 1, 1943. Compared with a year ago, declines
total employment were shown in all of the Regions except the Pacific.

mily labor (including farm operator) totaled 8,845,000 persons on June 1 — about percent over May 1, although 117,000 under June 1, 1943. As usual this seasonal inease was largely the result of the addition of school children to the ranks of allable farm labor with the close of the school year. Hired help reached 440,000 by the first of June compared to 2,697,000 on that date last year. This presents a gain of 451,000 workers during May which was slightly greater than the hal seasonal rise. Family labor including operator and unpaid family workers apposed 78 percent of the total farm labor force at the first of June.

vorable weather conditions in New England permitted the fullest utilization of ailable labor as farmers attempted to reach the normal stage of planting and tiller for this time of year. The number of hired workers in this region on June 1 was percent below a year ago and was only slightly offset by a 1 percent increase in mily workers.

the Middle Atlantic States, farm operations are now proceeding at a fairly even ce despite a labor supply which is limited and the employment of workers who are ss shilled than those formerly used. There were 613 thousand workers on these rms this June 1 — 33 thousand more than on May 1 but 19 thousand fewer than on he 1, 1943. In New York, farm work had been delayed by adverse weather in early y, but workers have been putting in long hours in the field in an attempt to get ops in without further delays. Favorable cultivating weather during May enabled Jersey farmers to keep up with the necessary field operations. Asparagus and inach harvesting has passed its peak in New Jersey with the strawberry crop in the ek season in early June.

most parts of the East North Central States good progress has been made in recent eks in planting and cultivating of row crops, although in some sections fields are

still too wet to be worked. Gardens and truck crops are showing rapid growth. The labor supply is none too plentiful, particularly in sections of more northern States, but farmers and their help are working longer hours to compensate for the small number of workers. In the East North Central States as a group, however, there were almost exactly the same number of persons employed on farms as on that date last year.

Somewhat similar conditions prevail in the West North Central region but in that area the number of family workers and of hired workers both fell below June 1943 levels. To a greater extent than usual farmers are practicing the good neighbor policy of helping each other in getting their farm work done. Many are working far into the night using headlight attachments on mechanized equipment. Floods and high winds retarded work in the northern section, but for the Region as a whole grain crops are making good growth, corn is up to a good stand and hay crops and pastures are in very good condition.

Improved weather conditions in May speeded up farming activities in the South. Early plantings progressed well — corn, wheat, and small grains particularly; pastures were in excellent condition; and harvesting of early crops is proceeding rapidly. More rain is needed in some areas, especially in the truck crop regions of Florida and Georgia, the eastern shore of Virginia, and the ranges of western Texas. The labor supply appears adequate at present, but as the season progresses, the need for additional help is expected to become more pronounced. On June 1, farm employment in the South Atlantic region totaled 2,285,000 compared with 2,002,000 May 1 and 2,340,000 on June 1, 1943.

A cold spell in the Mountain States slowed down sheep shearing operations, particularly in Wyoming where a considerable loss of old ewes resulted. Ranges are in good condition except in southern Yew Mexico where drought continues. Plantings are proceeding in all States but skilled labor is reported as scarce in parts of Idaho and Wyoming. As in most parts of the country, farm operators are working longer hours this June than last.

The greatest increase in farm employment during May appeared in the Pacific Coast States, where the total number of persons working on farms advanced more than 16 percent. Many jobs are now being performed in California which require large numbers of seasonal workers: peach thinning, cherry harvest, beet thinning, and harvest of various vegetables, potatoes, hay, grain, and flax. Cotton chopping in the San Joaquin Valley is nearly completed. Additional workers are needed in Washington, as farm work is still a little behind schedule for this time of year.
