Washington, D. C.

July 14, 1944

FARM EMPLOYMENT LOWER THAN YEAR AGO WAGE RATES HIGHEST OF RECORD

The Department of Agriculture reported today that of the 11,355,000 persons estimated to be working on farms in the United States the first of July those who received wages were paid at the highest rates of record. Farm employment was down about 3 percent from July 1, 1943 and about 9 percent from the 1935-39 average. Wages paid to farm workers, however, were 20 percent higher than in July last year and abour 2 3/4 times as high as in the 1935-39 period. The farm wage rate index of 328 on July 1 is 36 points higher than it was in April 1944 and is 54 points higher than on July 1 a year ago. Thus the quarterly increase in the farm wage rate index which began in January 1941 has continued to the present with each quarterly index higher than the one preceding it.

All parts of the country report higher wage rates than for July 1, 1943, with the largest gain (25 percent) recorded by the West South Central Region.

The employment of unpaid family workers on July 1 is estimated at 8,623,000 persons or only 2 percent less than a year ago. In two regions, the East North Central and the Pacific, the number of family workers was slightly higher than the previous July but all other geographic divisions recorded small decreases in numbers of family workers employed on farms.

Hired farm employment, estimated at 2,732,000 persons, was off 8 percent from July 1, 1943 and was 13 percent lower than the July 1 average for the 1935-39 period. The Pacific Region showed a slight gain compared to last July but all other areas reported reduced numbers of wage workers with the biggest declines occurring in the South Atlantic and East South Central regions. Part of this decline in hired farm employment in the Old South is no doubt due to the reduction in acreage in acreage. A late spring plus uncertainty as to labor supplies caused many farmers of shift to other crops requiring less hand labor or to allow their fields to lie

or the country as a whole, the index of supply of farm labor on July 1 was 55 perent of the 1935-39 base and that for demand 125 percent, both being the same or ery close to the indexes for July 1943. Thus, in the opinion of crop reporters

the situation relative to the supply of and demand for farm labor is about the same as in July of last year. The farm labor force this summer continues to be made up of an unusually large percentage of farm women and children, townspeople, war prisoners, foreign workers, and others, some of whom have had little experience at farm work. These people are making an important contribution to the wartime job of food production but frequently their lack of skill and unsuitability for certain types of farm work create a difficult problem for farm operators. The chart on page 11 indicates the increasing spread between the size of the Tabor force and the aggregate size of the farm enterprise. It is clear that the output per worker has increased sharply in recent years.

New England - In New England, the season is about up to normal. Cultivation of row crops, haying, and spraying and dusting fruit and vegetable crops are the dominant farm operations in early July. The supply of farm labor is, of course, short and particularly in regard to experienced workers that can instruct and supervise inexperienced help. A considerable number of laborers have been brought from Newfoundland and Jamaica for work on New England farms. Farm wage rates currently reported are somewhat higher in New England than they were in April of this year, and considerably higher than in July a year ago. The number of people working on farms is lower than at this time last year.

Middle Atlantic States - This is a particularly busy season for farmers in New York New Jersey, and Pennsylvania as they are engaged in cultivating row crops, cutting hay, threshing grain, and harvesting fruit. Every one on a farm who is able to do any work at all is in the field at this time and in addition large numbers of women and school children from towns and villages are being employed at farm work. Later in the month potato digging will get under way and additional workers will be needed at that time. It is expected that this need will be met to some extent by migratory workers from the South and by foreign importees, many of whom are now working on farms in this region. Employment of hired workers was down 7 percent from July 1943. This was the greatest percentage decrease for any region except the South Central.

East North Central States - At the turn of the month the weather over most of the East North Central region was favorable for farm work. Harvesting of wheat, hay, and oats was in progress and fruit picking was getting under way. The delayed planting of row crops and the early harvesting of small grains has doubled up farm work in many areas so that planting, cultivating, haying, and small grain harvest are all going on at the same time. The fuller use of tractors and tractor equipment plus long hours and wide cooperation among farmers is getting the job done in a generally satisfactory manner despite limited labor supplies. Farm wage rates have continued to increase in this region as elsewhere and are the highest so far reported during the present war. The number of family workers increased slightly over July a year ago, but hired farm employment dropped about 6 percent.

West North Central States - The estimated number of workers on farms in the West North Central region is relatively lower than in the East North Central region compared to a year ago. This reflects a generally tighter farm labor situation in this area than exists farther east as indicated by the farm labor demand index and the relative change in farm wage rates compared to July 1943. The Office of Labor is cooperating with the State Extension Service in recruiting domestic workers from the other States for the wheat harvest. In addition, Mexican Nationals will be moved into the wheat harvest as soon as arrangements can be made to release them from

ugar beet hoeing in the inter-mountain States. Wage rates in the West North entral region increased from July 1943 to July 1944 about the same as the U. S. verage.

uth Atlantic States - Farm operations in the South Atlantic States the first of ly varied from the "summer lull" in Florida to rather intense activity farther orth. The weather was favorable for farm work throughout most of this area at the irst of the month. The estimated total number of people working on farms July 1 as about 5 percent less than for the previous July but hired employment was lower y 15 percent. Part of this decline in number of wage hands is attributed to the eduction in cotton acreage from last season of 3 to 20 percent in the Coastal tates. It is reported that this year the labor force includes greater numbers of risoners of war, conscientious objectors, penal prisoners, and imported foreign orkers than in any previous season. The exchange of work between farmers is robably a more important factor in this region than ever before.

est South Central States - Drought in Kentucky and Tennessee may account in part or the decreased number of hired workers on farms in the East South Central region. Sowever, with a general decrease in acreage of crops in this region compared to a ear ago and especially in the acreage of cotton, the need for hired workers on arms in this region would be expected to be somewhat less than in 1943. The index of demand for farm workers was 121 on July 1 compared to 128 April 1 and 122 the list of July last year, thus although the actual need for workers may be somewhat ess, the demand for workers, that is to say experienced workers, continues uncated.

est South Central States - The West South Central States had excellent weather for ping field work and a great many different operations were in progress the first July. Harvesting small grains represented the major labor need at the time, though planting sorghums, cultivating late corn, harvesting hay crops and getables all placed drains upon the limited labor supply. As elsewhere, farm ge rates were higher on July 1 than they were a year earlier and the 25-percent crease in the wage index was the largest for any region.

untain States - The many Mexican Mationals who have been brought into the untain region to work on farms have done much to relieve the farm labor situation, specially insofar as sugar beet production is concerned. Such workers, however, to not being employed to the full extent possible for such jobs as haying, haresting truck crops and helping with livestock as many farmers appear reluctant to se workers other than the type they have been accustomed to in the past.

cific Region - The farm labor situation on the West Coast does not appear to be critical as a year ago. The supply index is up a little and the number of cople working on farms July 1 is slightly higher than for the same date last year. It farm wage rate index rose 15 percent or less than the national average.

Exican Nationals are becoming an increasingly important factor in the labor force coast States. In addition, strenuous efforts made to recruit women and children and others not normally a part of the farm labor force have greatly helped in etting the farm work done. The employment of hired workers on farms is increasing

seasonally and many activities requiring large numbers of workers are now in progress. Farm wage rates governing a number of operations have been stabilized by the War Food Administration through State wage boards. Up to July 1, wage ceiling regulations had been established so far this year covering wage rates for harvest of 10 different items including asparagus, hay, potatoes, oranges, peas, cherries, apricots, lettuce, and peaches and for certain workers on dairy farms. Most of these regulations were put into effect in California but some also in Oregon, Idaho, and Delaware.
