FARM EMPLOYMENT UP AS SPRING PLANTING SEASON APPROACHES

Snow-cover still hampered field work in the more northern portions of the country and wet fields retarded spring plowing in many other sections, but the number of persons employed on farms made about its usual seasonal rise during February, the United States Department of Agriculture reported today. About 8,400,000 persons were working on farms on March 1 of this year. This represented an increase of around 360,000 persons during February compared with an average seasonal upturn of 332,000 workers during the month in the 10 years, 1935-44. Having increased from a very low midwinter level, however, March 1 farm employment was still nearly 150,000 persons less than a year ago and the lowest estimated for the month during the 21 years of record.

Confirming the scarcity of able-bodied hands available for hire in rural areas, the number of hired workers employed on farms on March 1 totaled only about 1,500,000 persons, up only about 25,000 from a month earlier and down over 100,000 from March 1, 1944. Increases over a year ago were registered only in the West South Central and Mountain States, with declines recorded elsewhere. As of March 1, the length of the farm workday also dropped a fifth of an hour under March 1, 1944. This decline was applicable both to operators and hired help. The average workday for hired hands on March 1 was 9.5 hours; no longer than on March 1, 1940. Farm operators, however, were still working an average of 11 hours per'day, up seven-tenths of an hour over 5 years ago. Snow-cover and above-normal precipitation undoubtedly contributed to the decline from March 1944 in the number of persons working and the average length of workday in many sections. However, the difficulty in signing up hired hands as the spring planting season approaches probably was of even more importance in a large part of the country in accounting for the decline in the number of hired hands employed. An increase in the number of female farm workers and in part-time employment in nonagricultural industries may also have contributed to the shorter farm workday.

Percentage-wise, the decrease in the number of family workers from March a year ago was rather small, amounting to only about three-fourths of 1 percent as compared with a 6.5 percent reduction in hired workers. The number of family workers (including farm operators) employed on the first of this month added up to nearly 6,300,000, or about 235,000 more than a month earlier and only around 40,000 less

than on March 1 last year. If these shifts continue, family workers likely will be called upon to do an even larger proportion of nonharvest operations on United States farms in 1945 than at any other time on record.

Field Work Not Yet Started in New England

March 1 was still the inactive season in <u>New England</u> as far as field work was concerned. The 213,000 workers employed on farms at that time were mainly occupied with the care of livestock, cutting wood, and other minor farm jobs. Snow-cover was still heavy in most parts of the region and has interfered with the movement of hay and feed and other seasonal farm jobs. The harvest of the maple sugar crop got under way in a few sections as above-normal temperatures started the sap to flow in the earlier producing sections.

Some field work was possible in the <u>Middle Atlantic States</u> on March 1, but extensive snow-cover and wet fields still prevented preparation for spring planting from getting under way. Farm activities, therefore, were restricted, for the most part, to farm chores. Employment increased somewhat less than usual in this region during February, reaching a total of 500,000 persons on March 1 as compared with 515,000 a year earlier.

The snow-cover receded considerably in the <u>East North Central States</u> during February but fields were still blanketed in Michigan and Wisconsin on March 1. Pre-spring planting work also was retarded elsewhere in the region, however, because of above-normal precipitation and wet grounds. About as many farm workers (1,250,000) were employed in this region on the first of March as a year ago, a small decline in the number of hired hands being offset by an increase in family workers. Both groups, however, were reported as working fewer hours per day this year than a year ago. Some seeding of cloverseed on wheat land was reported in Illinois as well as scattered instances of cornshucking, but by March 1, farmers had not made much of a dent in the backlog of work which had piled up during the extremely hard winter.

In the <u>West North Central Region</u> more family workers have been reported than a year ago, owing to the scarcity of workers available for hire. The manpower problem on some livestock farms in this region has been reported as acute. Snow-cover, except in Minnesota and parts of Iowa, has receded, but heavy precipitation has hampered field work in other parts of this region. Chores, butchering, and the care of livestock constituted the bulk of the farm work load on March 1, although in the potato-producing Red River Valley considerable activity was reported in grading and preparing potatoes for market. The shorter farm work day probably was accounted for, in part, by bad weather.

Precipitation in most of the <u>South Atlantic Region</u> was above normal during the week including March 1, thereby retarding farm activities. Farmers in many sections of this region have not been able to get into the wet fields for spring plowing. This fact along with the general scarcity of available workers helped to account for the decline in number of hired workers from 362,000 on March 1, 1944 to 318,000 on March 1 this year. In some areas, an increased lay per hen

and milk production per cow suggests that farmers are taking better care of reduced livestock numbers. With spring land-preparation lagging due to excessive moisture, farmers have had ample time to cut fuel wood for home use in most of the South Atlantic States. By March 1, sowing of tobacco beds was completed as far north as North Carolina.

Reports from the <u>East South Central Region</u> indicate that heavy rainfall again may have helped to account for a shorter workday. This is reflected in a lag in the February increase in both family and hired workers employed on farms in this region behind the normal seasonal rise for the month. From Kentucky and Tennessee, however, come reports of an occasional return to farms from war industries because of the increased returns from crops such as tobacco.

Unlike reports from other parts of the country, those from the <u>West South</u> Central Region show a decrease in family workers from 1,126,000 in March of last year to 1,101,000 on March 1, 1945, with an increase in the number of hired workers from 263,000 to 277,000. The draft of an increasing number of farm boys and the concomitant necessity for hiring additional workers was commented upon by many respondents in this region. Wet grounds reduced field work in many parts of the <u>Southwest</u> on March 1, but carlot shipments of citrus fruit from Texas during the week ended March 3 indicated greater activity in the Lower Valley citrus harvest than a year earlier.

In the Mountain Region there were also fewer family workers and an increase in hired workers on March 1 as compared with a year ago. Shed lambing had started as far north as Wyoming by March 1. Harvest of citrus fruits and winter vegetables was under way in Arizona. Although shipments during the week ended March 3 were 29 percent smaller than a year ago, most of this reduction was due to the sharp decrease in shipments of lettuce and romaine from the Yuma district.

With a receding snow-cover and less than normal precipitation in the northern sections of the <u>Pacific</u> region, the numbers of persons working on farms on the first of this month had regained the level of a year earlier. In Washington State, spring plowing had begun in earnest on March 1 and some early crops were being sown. Soil conditions there were very good, with sufficient moisture to make plowing fairly easy in most sections of the State. In California, normal seasonal farm activities were taking place, winter vegetables being harvested, spring and summer truck crops planted, citrus rolling to market, and orchards and vineyards pruned. Cotton picking was still under way in the San Joaquin Valley.

NEW SURVEYS OF FARM WAGES. AND FARM WAGE RATES UNDER WAY

In recognition of the need for more information relating to farm labor problems, Congress has provided funds to the Bureau of Agricultural Economics to expand its collection of data on wages and wage rates of farm laborers throughout the country. The expanded program will include enumerative national surveys of wage rates haid regular and seasonal hired farm workers on a sample of approximately 20,000 farms, surveys of seasonal wage rates paid for harvest operations in selected special crop areas, and additional mailed questionnaire surveys to provide new types of farm wage information by States.

Surveys are already under way in Florida, Texas, and California of wage rates and wages paid workers for the major harvest operation of special crops in important production areas. Since many of these jobs are paid at piece rates, information is also being obtained on length of time worked in order to know how much workers really earn per hour or per day at specified rates. By obtaining data for individual workers, new information will be available on the differences in wage rates and performance between different types of workers, and on the percentage of workers receiving specified levels of wages for a given operation.

Firmers in one locality need to know not only about wage rates there, but also about rates and wages in other areas that grow the same product or use the same workers. The results of the wage surveys in the special crop areas will be summarized each month in the Farm Labor Report. Preliminary results from surveys made in Florida during February follow.

WAGE RATES AND EARNINGS OF CITRUS FRUIT PICKERS AND STRAWBERRY PICKERS IN SELECTED AREAS OF FLORIDA, FEBRUARY 1945

Prevailing piece rates for picking citrus fruit and strawberries in Florida in February resulted in great differences between the hourly earnings of citrus and strawberry pickers. Special surveys, which obtained wage information on citrus pickers employed by packing houses in the principal citrus producing area of florida and on strawberry pickers in Hillsborough County, indicate that the average worly wages for citrus pickers were \$1.05 for oranges, \$0,85 for grapefruit, and lince strawberry pickers averaged only 32 cents per hour. Comparison of rates and earnings done during the same period as citrus picking, afferences in agricultural wage rates and earnings of farm workers doing different to the leading strawberry county in the State and the survey covered the peak of arrest.

Verage rates - As a result of certain upward adjustments which have been permitted, he average rates paid per box for citrus fruits exceeded slightly the basic ceilng rates set by WFA. The average rate for picking a bex of tangerines, for example as 30.6 cents as compared with the ceiling rate of 30 cents. Almost all the strawerry pickers received 5 cents a quart for picking strawberries, with enough reelving 6 cents a quart to bring the average rate to 5.1 cents per quart.

aily wages of citrus and strawberry pickers - Citrus pickers not only had higher verage hourly wages than strawberry pickers, but they also worked more hours per w, resulting in even greater differentials in daily than in hourly earnings. The mestic white citrus pickers averaged \$8.10 wages per day, while strawberry pickers veraged only \$1.90 per day. Associated with these wage differentials between the groups of workers is the fact that most of the citrus pickers were adult males,

while most of the strawberry pickers were girls and boys 10 to 17 years of age. However, the small number of male strawberry pickers aged 18 through 44 -- only 8 in the group -- averaged only \$3.00 per day. This may be partially accounted for by the fact that strawberry pickers averaged only 5.7 working hours per day. Ordinarily, strawberry picking does not start until the ground is dry. Furthermore, strawberries picked on one day cannot be held over until the next day for shipment. Picking must stop, therefore, in time for each day's pick to be packed, loaded on cars, and rolled to market. The reported weekly earnings of strawberry pickers represent only those earned on the farms surveyed and do not include those that may have been earned during the same week on other farms.

Wages of strawberry pickers and other hired farm workers in Hillsborough County—Strawberry pickers, with average hourly wages of 32 cents per hour, made less than other hired workers on the same strawberry farms, who averaged 43 cents per hour in cash wages. A majority of the other hired workers on strawberry farms were strawberry packers, mainly women, who were paid from 1-1/4 to 2 cents per pint for packing. The pickers also made less per hour than all hired farm workers in Hillsborough County averaged in January, before the strawberry picking season began, During the week ended January 13, 1945, the average hourly wage for all hired farm workers in the county was 39 cents, and the average for those paid by the hour or day without meals was 44 cents per hour. Only a very small proportion of the strawberry pickers received meals in addition to cash wages; 95 percent of the entire group were paid a piece rate of 5 or 6 cents a quart without any meals furnished.

Comparison of wages of different types of citrus packers - Domestic citrus pickers made the highest average hourly earnings, \$1.05 per hour for colored pickers and \$1.03 for white. But domestic white workers had higher average daily and weekly earnings than domestic colored because of working longer hours per day and per week. Earnings of imported fereign workers (colored) were somewhat below domestic colored workers, having hourly earnings of 96 cents, but because of longer hours per week they averaged \$34.90 per week, exceeding the \$30.50 weekly average of domestic colored citrus pickers. These weekly wages represent only the amount earned by specific individuals while working on this crew from which the record was obtained and do not include earnings the worker may have received from other jobs.

Only a small number of prisoners of war were included in the sample, so that the estimates derived from their records may not adequately represent all prisoners of war picking Florida citrus. These prisoners worked longer hours per week than any of the other groups, 38 hours per week as compared with 36 hours for domestic white and imported foreign workers, and with 29 hours per week for domestic colored pickers. But since the prisoners' average performance was so much under that of the other types of workers, their wages earned were only about half as much. (Actually the prisoners of war receive only 80 cents per day and the rest of their wages go to the United States Government.)

Distribution of citrus pickers by earnings - Even within a given group of workers, the variation in wages earned per day or per week from the same piece rate is great One-fourth of the domestic white citrus pickers had average earnings of tess than \$6.00 per day worked, while 21 percent averaged \$10.00 or more per day worked. For domestic colored pickers, the corresponding percentages were 32 percent with earnings under \$6.00 per day, and 19 percent averaging \$10.00 or more. Of the imported foreign workers, only 10 percent averaged as much as \$10.00 per day, and 44 percent fell below \$6.00 per day. Because imported foreign pickers worked more days per week than domestic colored workers, however, the percent of them had weekly earnings of \$50.00 or more, while only 15 percent of the domestic colored pickers earned as much as \$50.00 while working on the crew from which the wage information was obtained for one pay-week. Among domestic white pickers, 22 percent made \$50.00 or more, and only 24 percent made less than \$25.00 during the week.

All others	: .33	2.90	17.70	8.8	53	6.0

^{1/} Estimates are based on records for a sample of crews including 1,019 pickers employed by packing houses in the most important citrus producing area of the State (14 counties), for a pay-week ending nearest to Feb. 22, 1945. These preliminary results are based on unweighted averages and may be revised if further analysis indicates that the heavier sampling rate used for larger packing houses affects the averages shown.

²/ Prisoners of war actually receive only 80 cents a day of the wages indicated; the rest goes to the United States Government.

^{3/} Estimates for strawberry pickers and for other hired workers on strewberry farms are based on data from a survey of a sample of 115 strawberry farms in Hillsboro County. In the surveys, reports were obtained on 622 workers, including 404 strawberry pickers, who were working for wages on these farms during the week ended February 17, 1945. Estimates for all hired farm workers in Hillsboro county are based on data from a survey of a sample of 224 farms, approximately 1/18 of all farms in the County. In this survey reports were obtained on 133 hired workers employed on these farms during the week ended January 13, 1945.

 $[\]frac{4}{2}$. These estimates relate only to workers paid by the quart without meals; such workers made up 95 percent of the total number of strawberry pickers.
